In Gratitude and Respect

Table of Contents.

Preface to the English Edition.	4
Preface.	5
Part I. Monopoly in the Days of Early Industrial Capitalism.	7
Chapter I. The History of Early Capitalism.	8
Chapter II. The Organisation of Monopolies.	17
Chapter III. Effects of Monopolies: Their Fall.	36
Chapter IV. Comparison with German Development.	55
Part II. Free Trade and the Earliest Monopolist Combinations.	70
Chapter V. The Doctrine of Free Competition.	71
Chapter VI. Monopolist Combinations in English Mining.	77
Part III. The Modern Organisation of English Industry on a Monopolist Basis.	120
Chapter VII. Introductory. Transition to the Present Time.	121
Chapter VIII: The Sphere of Competition.	128
Chapter IX: Existing Monopolist Organisations in English Industry.	146
Chapter X. Questions of Organisation.	192
Chapter XI. Theoretical Conclusions and Criticisms.	201
Appendix I.	224
Appendix II.	229
Appendix III.	236
Notes.	240

Preface to the English Edition.

This book was written and more especially translated in the hope of offering to Englishmen interested in the economic problems of their country, some account of its present industrial organisation. That organisation is characterised by monopolist tendencies which run counter to the hitherto prevailing regime of free competition. In England, the pioneer in economic history of competition, this development should excite the greatest interest; yet it is in England of all countries that the least recognition has been given to the economic importance of this new form of industry.

The present work attempts to explain the existing organisation of English industry by a study of the history of monopoly and competition, and at the same time to give an analysis of English cartels and trusts as they now are. I have tried to approach my subject without *parti pris*, and solely to describe and analyse. As I regard the historical alternation of monopoly and competition as an economic necessity which dogmas and evaluations unavoidably coloured by contemporary prejudice cannot affect, I have no personal bias to discount. It is, however, the duty of science to show what facts give or have given rise to these two systems of industrial economy respectively, and though itself without ulterior motive to assist those who wish to be guided by knowledge in the attainment of their objects.

I should be grateful for any corrections on points which I have misunderstood or treated insufficiently; and I must in conclusion express my warmest thanks to my translator. To his energetic and intelligent assistance the appearance of this book in English is primarily due.

Hermann Levy.
Heidelberg, April 1911.

Preface.

I have no intention of writing a preface summarising the main ideas of the following enquiry. I should like, however, to explain shortly how the material was collected, on which my account of former and existing monopolies and my theoretical conclusions are based. I owe very much to the excellent work of various English economic historians, and most of the facts used in treating of existing monopolist associations to Mr. Macrosty's very instructive book. For Parts I and III of my essay there were many previous books, both general works and monographs, from which I could gather useful facts and hints and which suggested promising lines of enquiry; but for Part II. I found practically no precursor. The laborious pioneer work of extracting details of former English monopolist associations out of long-forgotten Parliamentary Reports was, however, lightened by the delight of being one of the first in the field.

It was, of course, necessary to spend a considerable time in England. For some years the British Museum and the Patent Office were my headquarters during my holidays. The library of the former provided me with the historical information I needed, and the trade papers preserved in the latter explained to me the present day. For investigation into English industrial conditions the examination of these papers is especially necessary.

We in Germany, if only by reason of the number of theses produced, possess a large collection of more or less useful studies of particular industries, but in England such things only exist, if at all, in the case of the main industries. It is extraordinary that there are no monographs on the economic position of such things as iron and salt mining, the cement trade, industrial spirit and whisky distilling, the tobacco trade or engine making. The enquirer must turn to trade papers for information on their economic or technical position, their geographical connections or their finances. To these I added prospectuses of large undertakings — often very instructive material for my purposes — and reports of important events in the Commercial and Financial Supplement of the *Times*, the *Financial Times*, the *Manchester Guardian*, and that admirable paper, the *Economist*. But such a collection, taken mostly from newspapers and interested parties, could not, of course, be used without considerable scientific caution, and required to be interpreted in the light of personal statements, of criticism from the opposing interests and of explanations from the leaders of the industries in question.

I cannot sufficiently acknowledge the assistance I have received from all kinds of

persons, many of them friends gained at the time of my studies in rural economy who were also connected with urban industries. For valuable information as to the steel and iron trade, I have particularly to thank Sir Hugh Bell and the editor of the *Iron and Coal Trades' Review*, Mr. Jeans; for the paper trade, Mr. Dykes Spicer, Sir Albert Spicer, and Lord Northcliffe; for tobacco, Mr. A. C. Churchman; for the salt and soda industries, Sir A. Mond, M.P.; for the tinplate trade, Lord Glantawe; for coal mining, Mr. D. A. Thomas, M.P. My attempts to gain information even of the most elementary kind from the directors of large textile undertakings generally failed, and I cannot help feeling that the leaders of these monopolist associations desire to avoid discussion. I am the more grateful to Mr. W. B. Morison, of the London Stock Exchange, for placing his great experience of the textile industry and its combinations at my disposal. My investigations led almost continually to comparisons between English conditions and tendencies with those of German and American monopolies, and I derived much help from the results of my former visits to America.

In conclusion I would draw attention to the Appendices, in which I have included certain documents which I could not quote in sufficient detail in the text and to which I would particularly direct the reader. More especially would I recommend even those who are otherwise unwilling to spend time in studying appendices to read Lord Furness's speech. It is a most excellent illustration of that movement towards the concentration and combination of large industrial undertakings which has led many English industries towards new organisation on a monopolist basis, and which will continue to do so in the future.

Part I. Monopoly in the Days of Early Industrial Capitalism.

Chapter I. The History of Early Capitalism.

When the Industrial Revolution began in the second half of the eighteenth century, the organisation of English industry was better prepared for an advance than that of any other European state. It is true that, as elsewhere, industrial undertakings found their freedom of movement restricted by the survival, partly in law and partly in custom, of the gild system; but much as these restrictions were opposed to the interests of large capitalist industries, they could not repress the many enterprising spirits who were eager to use to the full the new developments of trade. Long before the actual repeal of the Statute of Apprentices and other gild regulations completed the freedom of English industry, the way had become open even within the bounds of industrial capitalism for individual activity and mutual competition. In other countries the productive activities of single economic units were limited not merely by the demands of the gild system, but in the majority of cases, even after that difficulty had been overcome, by privileges, concessions, monopolies and the official regulation of capitalist manufacture, which united to make individual operations difficult and often impossible.

In England also, at the time when industrial capitalism commenced, the system of granting privileges to particular persons prevented the growth of competition among many who were both willing and fitted to be leaders of industry. Only when that system, which gave advantages to the few at the cost of all the rest fell after prolonged struggles at the end of the seventeenth century, did that most important factor in modern freedom of industry, the abolition of all legal recognition of private monopolies, come into play. Nearly a century later a new technical and economic movement began, but the significance in this connection of the earlier won industrial freedom was not observed by the English economists. They regarded the free play of competition as a natural phenomenon in capitalist industry, and the unsophisticated reader might well imagine from their writings that no other system had ever existed since the rise of capitalism. The more this earlier triumph of free industry was taken as a matter of course, the more content economists were to apply the expression "freedom of industry" solely to the delivery of industry from the fetters of the gild regulations. As a result classical economy and its pupils never examined the liberation of English industry from the rule of monopoly in all its bearings, nor gave

it its true importance in economic history.

It is only now that in all countries, including England, a new form of monopoly is beginning to arise in industry, that attention is directed to the monopolies which saw the birth of early capitalism, and whose fall was the necessary preliminary of that epoch of free competition, which in its turn appears to be inevitably coming to an end through the action of cartels and trusts.

The period which can be marked out in the early history of English industrial capitalism as predominantly that of monopoly lasts from the end of the sixteenth century to about 1685. Not that trade monopolies were unknown before that time; on the contrary they were very common. What made the monopolies of the time of Elizabeth, James I and Charles I appear in many ways something new, was that they bore a purely capitalistic impress, and perhaps for this very reason represented national industrial organisations in contradistinction to the former trade monopolies¹ of the guilds which were of purely local importance.

The period starts with the rapid economic expansion at the end of the sixteenth century. During the reign of Queen Elizabeth, and even more in the first ten years of the seventeenth century, a great number of new industries were introduced into England partly by foreigners and partly by Englishmen.² The majority were from the beginning of a capitalistic character, and far removed from the domestic handicraft. The adventurers consisted in most cases of well-to-do foreigners acquainted with the new industries, native merchants or rich courtiers, and the amounts invested were often not inconsiderable even in comparison with modern times. The four capitalists who undertook the working of the Yorkshire alum deposits in 1607 put £20,000 to £30,000 into this undertaking within a short period. In 1612 it was estimated that any one of the six existing companies employed 60 hired labourers, not counting foremen and their assistants or the necessary mechanics. The total expenses of such a company were put at about £2100 yearly.³

Salt mining and the glass industry were also organised from the beginning on a capitalist basis.⁴ The last — if we neglect primitive beginnings — first became important in 1619, when Sir Robert Mansell started to erect glass works in Newcastle, which still survived till about 1855. He undertook to make a yearly payment of £1000 to the Crown.⁵ That he employed 4000 men is, no doubt, an exaggeration,⁶ but it is clear that the whole enterprise was of a purely capitalist character. Soap was another industry introduced in the time of Elizabeth, although

the novelty in this case consisted chiefly in the adoption of an improved process of manufacture, which, it was hoped, would make England largely independent of imports.⁷ As early as the first half of the seventeenth century soap boiling was no longer reckoned as one of the crafts which came under Elizabeth's Statute of Apprentices, but was "an art of mystery,"⁸ which any free burgess, knowing the process and possessed of the necessary resources, might practise. In the middle of the eighteenth century a considerable sum, relatively speaking, was considered necessary, according to trustworthy evidence, for the initial capital of each concern, the work being done by "Labourers" and "Foremen," no longer by Journeymen.⁹ There is no doubt that as early as the seventeenth century the manufacture of soap, where not carried out in private houses, was organised in a capitalist fashion. The Company of Soapmakers of Westminster incorporated in 1631 was prepared to deliver wholesale, and promised the Crown to supply 5000 tons of soap yearly. When the business was transferred in 1639 to another company the latter paid for plant and material a purchase price of £20,050.¹⁰

As a last example of the new capitalist organisation we may take the wire industry. While in Germany wiredrawing mills driven mechanically were introduced as early as the first half of the fourteenth century,¹¹ the use of water power for drawing wire was first brought into England by a German in the second half of the sixteenth century. Till then, though the wire industry was practised as a craft in various parts of England, and especially in the Forest of Dean, the main supply, both of wire and carding wire, had to be imported. On the introduction of the new process a large capitalist factory arose at Tintern, of which we are told that it often produced more in the year than it could dispose of in England. When leased in 1592 the factory commanded a rental of £1000 a year, and employed workmen who received as much as £80 a year in wages, and were attracted from a distance, besides "many thousand poor" who found employment in the works of the company incorporated in 1568. On the other hand the finishing processes remained in the hands of craftsmen, who drew their raw material from the capitalist factories.¹²

Contemporary mining shows another group of capitalist undertakings. At the end of the sixteenth century Cornish tin mining was in an unfavourable position; many works had come to a standstill owing to the increasing cost of working in deeper levels;¹³ and the introduction of pumping machinery had become an essential preliminary to any increase of production. Presumably to bring the capital necessary

for this purpose into the mining industry, Queen Elizabeth conceded her royal mining rights to a number of capitalists, a policy continued by the English kings until 1643.¹⁴ As a consequence the producers, hitherto independent miners and smelters, became economically dependent on capitalists. In 1630 Judge Doderidge complains that “the mine workers in respect of their poor Estate are eaten out by the hard and usurious contracts for tin”¹⁵ (a state of affairs exactly parallel to the conditions ruling as early as the sixteenth century in German tin mining),¹⁶ “as those poor labourers being not able to maintain themselves and their families ... are by necessity compelled for a small sum of money to enter bonds with the said regraters of tin, in value much more than the money they had received from them.”

The persons here called “mine-workers” must, it is true, be still regarded as formally independent, in spite of their name, as they produced their tin at their own cost and risk. But in reality they were nothing but the instruments of their capitalist purveyors, who sold to the “labouring tinnners” at extortionate prices the necessary mining materials, receiving payment in tin at far beneath its market value.¹⁷ Further, the smelters were compelled to have recourse to advances from capitalists¹⁸ by the provisions of the law as to sales, which only allowed tin to be delivered twice a year, at Midsummer and Michaelmas.¹⁹ On the other hand the producers, thus dependent on capitalist assistance, were in their turn employers, for the great mass of those employed in tin mining were ordinary labourers. As early as 1601 Sir Walter Raleigh, who knew tin mining well, spoke of the “poor workmen” who formerly received 2 shillings a week, but now 4 shillings.²⁰ A document of about the same time states²¹ that “the most part of the workers of the black tin are very poor men, and, no doubt, that occupation can never make them rich ... for they have no profit of their tin if they be hired men, for their masters have the tin.”

The need of capital, therefore, brought with it a triple classification of the persons concerned in the industry — first, the capitalist trader; secondly, the producer or working master without resources of his own and drawing all his supplies from the capitalist; and lastly, the labourer he employed.²² During the seventeenth century the state of affairs so far changed that the capitalists became themselves “adventuring tinnners” working their own mines, and further, had an interest “in most of the smelting-houses, which they either managed themselves or leased to poor smelters.”²³ In this way there arose in tin mining after 1600 a class of capitalists who appeared on the one hand as traders under the name of “merchants,” supplying independent

working masters, and on the other hand gradually became themselves “masters,” and laid aside the disguise of mere traders. The final stage of this development was reached when the London merchants’ agents, who had formerly disposed of the tin to the finishers, were gradually extinguished, and the capitalist smelters took over the tin trade and sent their orders direct from London.²⁴ According to the statements of Mr. Lewis this system is still in vogue.

The most important factor in the early English industrial capitalism was, however, the development of North of England coal. The first authentic records go back to 1213.²⁵ About 1246 coal from the Newcastle district received the name ‘sea coal,’ which proves that already in those days it was carried by sea. From the end of the sixteenth century its hold on the more distant markets, more especially on London and the neighbourhood, continually increased. While, according to Harrison, export coals “had first taken up their innes in the greatest merchants’ parlours” in 1577,²⁶ about 1640–50 an increase in the price of coal was already considered a great injury to the poor.²⁷ Originally only irregular shipments, the export of coal to France had so developed by 1552 that “France can lyve no more withoute” English coal “than the fische withoute water”;²⁸ and in the days of Elizabeth the trade thus rapidly rising to importance was used for revenue purposes by the introduction of an export duty on coal.²⁹ But the chief increase in shipments took place in the seventeenth century.³⁰ The numerous statistics and figures of production given in various documents of the time appear on inspection so contradictory that they are not worth much, especially in view of the often uncertain details of weight. But it is a certain fact that the annual coasting trade was estimated in 1663 for revenue purposes at 160,000 chaldrons, or about 450,000 tons;³¹ and according to an official return in 1871 the entire coal production of England in 1660 was about 2 million tons.³² The statistics concerning the means of sea transport for coal are also striking. A single ship had a carrying capacity in 1421 of about 20 chaldrons (1 chaldron = about 2.6 tons), in 1653 six or seven times that amount was given as the average cargo.³³ In 1676 Sir William Petty put the tonnage of the vessels employed in the Newcastle coal carrying trade at 80,000 tons, and stated that it had increased fourfold in the last forty years.³⁴

As the outlet for North England coal in more distant markets increased, coal mining acquired the impress of a large capitalist undertaking. The Elswick mine, one of the most important, originally let by the Abbey of Tynemouth³⁵ in 1330 for a rent of £5 a year, brought in 200 years later only £20, but in 1538 £50. In 1582 Queen Elizabeth

leased the manors of Gateshead and Wickham, which were rich in coal deposits, for £90 a year, and shortly afterwards transferred her lease to the town of Newcastle for a payment of £12,000.³⁶ The yearly output of a number of collieries on the river Wear was valued in 1644, a year, it is true, of dear coal, at £3000.³⁷

The great attraction which coal mines had for capitalists — often to their undoing — is shown by the following description by Gray in the year 1649.³⁸ “South Gentlemen have, upon great hope of profit, come into this Country to hazard their monies in Coale Pits. Master Beaumont, a Gentleman of great ingenuity and rare parts, adventured into our mines with his thirty thousand pounds; who brought with him many rare Engines, not known then in these parts, as the best to boore with, Iron Roddes to try the deepnesse and thickenesse of the Coale, rare Engines to draw water out of the Pits, to the Staithes, to the River, etc. Within few years he consumed all his money and rode home upon his Light Horse.” The conditions of work at this time also show an entirely capitalist organisation. Gray relates that many thousand people were engaged in the coal trade, and that a single employer had 500 to 1000 persons “in his works.” And in 1662, 2000 miners sent a petition to Parliament complaining of the injustice of their employers. At the beginning of the eighteenth century several hundred people were employed in single collieries.³⁹ When it is remembered that in 1754 the entire production of the Grafschaft Mark was only 35,000 tons, the number of miners 699, and each mine employed under seven men,⁴⁰ the very advanced state of coal mining in the North of England as early as the seventeenth century, both in the quantity of its production and in its capitalist system of management, becomes even clearer.

Finally a large number of handicrafts were in the sixteenth century, and still more throughout the seventeenth century, financed by capitalists,⁴¹ and so gradually converted into capitalist industries. The extremely complicated process by which independent craftsmen came gradually into “indirect dependence on capital”⁴² has been recently reconstructed with excellent illustrations from authorities by Mr. George Unwin. Traders in foreign goods, oversea merchants, and middlemen formed a new class of capitalists, which by its command of money gained the mastery over the craftsmen. Even at the beginning of the sixteenth century the Haberdashers, then still chiefly dealers in fine goods from abroad, employed a large number of London craftsmen, who are said to have been in the most pitiable condition; while well-to-do masters also assumed the part of capitalists and pressed on the small masters, who

were crushed out — for instance, in felt-making and cloth weaving — between the capitalist masters on the one side and the simple journeymen and labourers on the other. For a long while the small masters sought to maintain their independence against the capitalists, partly by trying through an organisation of their own — the yeomanry organisation — to win a place in the old corporations now gradually falling more and more under the sway of the capitalist masters, and partly by striving to create a corporation of their own. The craftsmen also made attempts by combined action to emancipate themselves from the capitalists. The feltmakers collected £5000 in 1611 to make themselves independent of middlemen in the purchase of raw material, and to prevent themselves being compelled by financial needs to cut prices. But this organisation — a kind of limited company — only lasted three years. In the middle of the seventeenth century there was a deep gulf fixed between the small masters and their richer brethren, with whom they had united in the “Project” against the capitalist middlemen. On the one side stood the rich felt-makers, many of whom employed “ten, twenty, or thirty persons and upwards in picking and carding wool, and preparing it for use, besides journeymen and apprentices.” They had freed themselves from middlemen and become themselves capitalists. On the other side were the small masters, still dependent as before on the capital of others and faced with the certain fate of having to make way for the class of journeymen on daily wages. Other corporations had similarly tried to maintain their independence with the aid of co-operative undertakings and by attracting outside capital, and in every case the plea of finding work for poor members had been to the fore. It was so in the case of the horn-makers, the tin founders, and the cloth weavers, usually with the same eventual result as with the felt-makers.

A valuable document of 1618 (State Papers Domestic, James I, vol. lxxi. 13, year 1615) gives us some information as regards the capitalist organisation of the cloth trade at the beginning of the seventeenth century. It contained the following kinds of traders:

1. The rich clothier, who bought his wool direct from the wool countries and made his whole year’s provision beforehand, had it spun in the winter by his own spinners, woven by his own weavers, and fulled by his own tuckers, all of whom he paid “at the lowest rate for wages.”
2. The meaner clothier, who borrowed most of his wool “att the market,” employed many “poor men,” sold his cloth, and then paid his old debt. “Of this sort

there are a great store that live well and growe riche and sett thousands on worke.”

3. Clothiers who did not possess enough capital to buy wool in advance, but “doe weekly buy their yarn in the market,” and make it into cloth and sell it themselves. The yarn is made by “spinners” “who buy their woolle in very small parcells,” and put yarns on the market every week, for which they require the aid of chapmen.
4. Lastly, thousands of “poore people” who made coarse cloth “by their great Industry and Skill,” and were apparently in the same position as those named under 3.

The entire classification shows the opposition between the large capitalist makers, who provided themselves with raw materials and had them manufactured wholesale, partly on a domestic system and partly in factories, and the small independent master, who usually carried out only part of the process and relied on credit and middlemen. This opposition, whose existence in the fifteenth and sixteenth centuries is described by Prof. Ashley,⁴³ was permanently accentuated in the seventeenth,⁴⁴ though the complete extinction of the small master did not occur till the Industrial Revolution, with the rise of machinery and the final replacement of the domestic system of industry by the factory.⁴⁵

The attempts of the small master by some kind of organisation to maintain himself in the capitalist development of industry against those whom that development had aggrandised must be considered to have been hopeless by the time of the Civil War. By that time, wherever capitalism had introduced larger forms of industrial organisation, the poorer master craftsmen were a moribund class of independent producers who had no choice but to become day labourers.⁴⁶

Thus the general expansion of the trade, commerce and shipping of England in the seventeenth century brought a new organisation in the most diverse branches of industrial production. With the end of the sixteenth century, and then with every decade of the seventeenth century, industrial capitalism extended, most markedly in the industries newly introduced and in mining, slowly but steadily in trades till then entirely carried on by craftsmen.⁴⁷ In many cases the decisive influence was the extension of markets and the consequential increase in production. This in its turn required a larger accumulation of fixed capital, as for instance in mining or where increased machinery was required, and further necessitated the possession of capital

by the manufacturer to enable him to obtain supplies of the necessary raw material where wholesale purchases were profitable. In this way capitalism, either by supporting small industrial units, as in the case of domestic capitalist industries, or by building up large undertakings gained command over the most important English industries of the time.

The special form of organisation which was characteristic of this early industrial capitalism up till the end of the seventeenth century was the monopoly.

Chapter II. The Organisation of Monopolies.

The legal foundation of monopoly rested on the grant by the Crown to individuals or corporations of the sole right to carry on a given trade. Under Queen Elizabeth the system of trade privileges, as is well known, grew rapidly. There was scarcely a commodity which was not the object of a monopoly. On one occasion, when a long series of concessions was recited in Parliament, a member exclaimed "Is not bread in the number?" And to the astonished cries of "Bread!" he replied, "Yes, I assure you, if affairs go on at this rate, we shall have bread reduced to a monopoly before the next Parliament."⁴⁸

Elizabeth had repeatedly to promise the abolition of monopolies,⁴⁹ and finally, in 1601, after a Parliamentary debate in which most of the speakers expressed in the most unequivocal terms their exasperation with the existing privileges, a great number of exclusive rights were in fact suppressed.⁵⁰ But the era of monopoly was by no means ended thereby. The creation of grants, patents, etc., continued under James I. and reached a new highwater mark between 1614 and 1621.⁵¹ The reply to this development was the well-known Anti-Monopoly Act of 1624.⁵² The effect of this Act, which is still of importance to English lawyers, has often been wrongly estimated, so far as it concerned the actual creation of monopoly. M'Culloch, for instance, was of opinion⁵³ that it had given freedom of trade to English industry. The terms of the Act may no doubt have been inspired by doctrines akin to free trade, but it would be a mistake to imagine that it abruptly terminated the existence of monopolies, which, on the contrary, appear to have continued for decades afterwards in spite of this express prohibition. The explanation is this. In the first place the Act itself left a whole series of monopolies untouched, and secondly, it was divided into two parts, one of which consisted of an emphatic condemnation of all monopolist undertakings, while the other at the end of the statute (sections xii. xiv.) sanctioned afresh certain important monopolies. As has been said, the entire statute is characteristic of its creator, James I, the prince "with a head of gold and feet of clay."

At the same time, the Act of 1624 would have greatly limited the power of monopoly, had it not been frequently transgressed subsequently. Charles I's claims to rule without Parliament and to be financially independent of Parliament, drove him

to follow in the steps of his predecessors and to have recourse to the grant of patents. For this purpose especial use was made of the clause of the statute (section ix) which excepted civic corporations and companies from its provisions. It is true that originally it was only permissible to set up a corporation of a monopolist character within the area of a given town, and that in that town membership of such a corporation might not be restricted without further formalities. But the enterprising spirits who wished to conceal under such a corporation a national monopoly soon found a way out. They obtained a grant by royal ordinance of the right of "superintendence" over the whole national production, and finally a right to suppress all outsiders. The traditional right of the free burgess, especially the free burgess of London, to enter any company for the practice of his trade was similarly suppressed. In this way the London Starchmakers' Company, an undertaking managed by a few capitalists, had already become a closed national monopoly even before the Anti-Monopoly Act.⁵⁴ The Act made this method of founding a monopoly very popular, and after 1624 numerous corporations arose with the express object of forming national monopolies.⁵⁵

The provision of the Act (section vi) which allowed a fourteen years' patent for new discoveries opened up a further possibility or point of departure for the grant of monopoly. Starting from this vantage ground the possessor of a patent could acquire all kinds of privileges. He could be given a patent for his particular process and at the same time the right "for the protection of his patent," to keep watch on all other producers, a measure which in practice led to the exercise of monopoly rights.⁵⁶ A later writer even complains bitterly that this clause had been stretched to cover imported goods, unknown to English manufacturers, so that anyone who promised to produce such commodities in England could obtain protection against both foreign and internal competition.⁵⁷ The use of the clause as to patents for purposes of monopoly was so general that the word "patentee" meant in the period from 1630 to 1650 "monopolist."

"The Monopolist and the Patentee
Did joyne hand in hand as here you see"

is the legend under the frontispiece to an anti-monopolist pamphlet of 1642.⁵⁸ With justice did a member of Parliament declare, in a debate in 1640:⁵⁹ "Better laws could

not have been made than the Statute of Monopolies against Projectors; and yet, as if the law had been the author of them, there have been during these few years more monopolies and infringements of liberties than there have any year since the Conquest.”⁶⁰

In view of the Elizabethan monopolies, the last statement seems somewhat exaggerated, but the substance of the complaint is certainly true. The remarks of speakers from all parties during the debate prove the existence of a profusion of monopolists. The sarcastic speech of Sir John Colepepper in 1640 was famous. In one passage he declares that “these, like the frogs of Egypt, have gotten possession of our dwellings, and we have scarcely a room free from them. They sip in our cup; they dip in our dish; they sit by our fire. We find them in the dye vat, the washing bowl, and the powdering tub. They share with the butler in his bar. They have marked and sealed us from head to foot. They will not bate us a pin.”⁶¹

It must especially be remembered, in considering the effect of the Monopoly Act, that the legal conditions in mining up till the end of the seventeenth century offered in many ways great advantages for the creation of monopolies. The right of the Crown to claim ownership of all mines in which silver and gold were found became a means of monopolising copper, lead, and zinc mines. Since the time of Elizabeth the Crown had exercised this contingent right, not without provoking many lawsuits,⁶² and it led to the formation of the great monopolies of that time.⁶³ No radical alteration in the law was made till the time of William III, in 1689, when the expression “mines royal” was unambiguously defined by a new law. “No mines of Copper, Tin, Iron or Lead shall hereafter be adjudged, reputed or taken to be a mine royal, although Gold and Silver may be extracted out of the same.”⁶⁴

Thus the mining rights in these metals were finally taken away from the Crown and assured to the landowner, and in consequence the *raison d’être* of the notorious mining monopolies, the Mines Royal, Mineral and Battery Works, and the later combination of these two, the Society of the Mines Royal,⁶⁵ was removed.⁶⁶ The right of pre-emption of the Crown in the case of the tin mines in Cornwall and Devonshire remained. But the abolition in principle of the mining monopoly was doubtless the reason why the Crown made no further use of this method of creating a monopoly. It was used once more in the reign of Queen Anne; but after 1717 vanished wholly from the history of English mining.⁶⁷

The legal position reached at the end of the seventeenth century, therefore, no

longer put any obstacle in the way of free competition in the extraction of minerals. In coal the ownership of the landowner had been the rule in most cases from time immemorial. The law of 1689 put copper, tin, iron and lead in a similar position.

An exception remained in the so-called “free mining districts, “which were subject to the royal rights of the Crown. Free mining existed, for the Crown merely received dues and supervised the mine courts; but the mining villages had built up a complicated system of principles and regulations which influenced in various directions the organisation of each district. Generally speaking, no village in these districts set up a monopolist system of mining. Of the five free mining districts known to us, the Mendip Hills, Alston Moor, the tin districts in Devonshire and Cornwall, some parts of Derbyshire and the Forest of Dean, only the last was organised on the monopolist lines of a gild, while in all the others no special limitations seem to have been set by the local mining authorities on the grant of mining rights.⁶⁸ In the Forest of Dean, however, the Mine Law Court started after about 1660 to attempt monopolist control over production and markets in all kinds of ways — by attaching various conditions to the permission to mine as a “free miner,” by fixing the prices, even by assigning definite prices to particular markets, and trying to limit the production of individual miners.⁶⁹ In 1675, however, this organisation seems to have been broken up by outsiders, who, in defiance of the Court, but also without interference from it, began to mine “with the express purpose of working against a coal monopoly. “These “foreigners,” as they were called, in contradistinction to the “free miners, “ became more and more numerous, especially when the Mine Court came to an end in 1777, and the “free miners” relinquished their property more and more to strangers.⁷⁰ Still the possibility of monopoly lasted longer here than elsewhere in English mining. The exception is, however, an inconsiderable one. In the other free mining districts, especially in the tin mines of Cornwall and Devon, there was no difficulty in acquiring mine concessions.⁷¹ Mining rights went with the ownership of the land, after the law of 1689 had finally settled and brought into general use this legal principle.

In the same year took place the final repeal of another legal enactment of the highest importance for the creation of monopolies. The claims of the Royal Prerogative to dispense with the law, by which Prerogative the Crown had granted monopolies over the head of Parliament by hair-splitting interpretations or even open evasion of the existing law, was abolished in the Bill of Rights. Even though the

number of existing monopolies had in all probability greatly decreased since about 1650 or 1660 — unfortunately we have no detailed record — the extinction of that right showed that Parliament had henceforth the power to prevent all private trade monopolies by means which could not legally be evaded. Only local monopolies based on gild and corporation rights and having nothing in common with the great national monopolies of the Tudor and early Stuarts could now exist, except where Parliament by its own act otherwise ordained. Great capitalist monopolies such as we have in view, controlling by legal privilege the entire national production of a given branch of industry, were once and for all impossible. The Long Parliament in 1640 had declared most of the monopolies void, and thereby taken upon itself functions in relation to the Crown for which it had no constitutional justification. After the Restoration the Crown found itself similarly hindered⁷² by the increasing power of Parliament⁷³ in the exercise of its former custom of settling industrial questions on its own initiative. This state of affairs received recognition in theory by the abolition in 1689 of the Royal Prerogative, and the always latent⁷⁴ conflict between a Crown inclined to befriend monopolists and a Parliament that was bitterly hostile to them was thus finally decided in favour of the latter.

The legal conditions which were thus altered at the end of the seventeenth century had for about a century largely determined the creation of monopolies in its general aspect. But a number of other circumstances, such as the economic characteristics of the industries concerned, the various trade regulations, and the manner, in which the laws relating to the trade were administered had no less influence on the actual development of the monopoly in individual cases. The forms of such monopolies were very various. They differed from one another, owing to the differences and permutations of the above and other circumstances, in structure, in the size of their sphere of action, and in economic potency. No correct estimate of the actual importance of the early monopolies in the economic life of the day can therefore be gained without an examination of individual monopolies and their special peculiarities.

Some of the most important, curiously overlooked by recent investigators,⁷⁵ are to be found in mining, and especially in coal mining. Even without the aid of the law the large consuming centres were limited for their supplies of mining products to particular producing areas, which either because of the primitive means of transport or from lack of any competing source of supply soon acquired a monopoly. London,

for instance, could only get coal or tin from Newcastle and Cornwall even when the prices of those commodities rose very high. Clearly, if the exploitation of these natural monopolies was further delivered over by legal concession to a few individuals, or often to a single individual, a monopoly of unusual strength was possible.

We first hear of monopolies in the coal mines of the north in 1590. Their history is connected with the group of mines which, as has already been mentioned, belonged originally to Queen Elizabeth, and was then transferred to the town of Newcastle. The town made over its property to a company of free citizens called hostmen, and this company gave its rights to eighteen or twenty of its members, who became coal miners and coal merchants in combination.⁷⁶ This concentration of the coal trade in a few hands much disturbed the London buyers, the more so as the price of coal rose greatly between 1582 and 1590.⁷⁷ Rumours of a monopolist ring among northern coal miners were in the air, and in 1590 the Lord Mayor of London made complaint to the Treasurer Burleigh that the hostmen had “engrossed” the mines, and petitioned that “all mines should be worked and a maximum price of seven shillings a chaldron fixed.”⁷⁸

No special privilege from the Crown had so far been necessary for the growth of a monopolist organisation of production. But it by no means followed that there was no desire for additional State protection. On the contrary, the stronger the agitation of the consuming interests became, the more anxious the monopolists were to see their organisation sanctioned by the Crown. After further complaints in 1597 against the excessive coal prices,⁷⁹ hostmen seized a chance opportunity⁸⁰ to attempt to obtain incorporation as a guild. The town of Newcastle had for a long while neglected an obligation existing since the days of Henry V to pay a tax of 2d. a chaldron to the Crown. Queen Elizabeth claimed the debt, and the town made her the following proposal: the arrears to be struck off their debit account, and the queen further to grant a gild patent to a “brotherhood, called the free hostmen, for the sale of every kind of coal to the ships,” in return for which she should receive 12d. for every chaldron of coal carried by sea. The queen accepted this proposal, and on 22nd March, 1600, the aforesaid brotherhood became an incorporated gild. It was protected by the gild statutes and its exclusive rights from any external competition. On the one hand it had the monopoly of the most important mines; on the other it possessed the sole right to sell coal to the ships which entered the River Tyne, and held in its hands

the entire export trade,⁸¹ so that it could prevent the independent sale by possible outsiders of any coal they might produce. It held, in fact, a right of pre-emption sufficient to frighten off any competitor at the outset. The actual exercise of its rights was assured by the fact that most of the members of the gild held public offices, were free burgesses, and so on, and their influence served to maintain the gild's rights and privileges, and often to assert them by force. Accordingly we find the chief opponents of the gild identifying the hostmen with the corporation of Newcastle, and attacking the privileges of the town magistrates when their real objective is the gild patent and its exclusive rights.⁸²

But external protection by no means secured the internal harmony of the gild. That had to be assured by ordinances limiting competition among the hostmen themselves. That this step was taken immediately after the incorporation of the gild is proved by the Gild Book of the coalowners in 1602. This book contains "An Ordinance and Common Agreement for the Sale of Coal" among twenty-nine, or, counting partners, twenty-four hostmen. These twenty-four, who were all coalowners,⁸³ were only a small committee of the gild which had in 1600 forty-four members, but their decisions were regarded as binding. Within this committee of the four and twenty there were again four groups, each member of which might only sell a given amount of coal, no member being allowed more than nine times the amount assigned to any other member.

In other words, within each group the sale of coal was so regulated that the smallest sale must be to the largest as 1 to 9.⁸⁴ This organisation was clearly an early attempt to create a division of production, based on figures of participation.

This system continued unchanged under James I, though the complaints against its control of the market had by no means ceased. We find in Gardiner⁸⁵ that about 1620 the Attorney-General filed a complaint in London against the town authorities of Newcastle concerning the free hostmen, that, having all the selling of coal in their hands, they compelled ships to take bad coal, and even delivered coal unfit for sale, to the great harm of the people.

In spite of this, the Coal Gild received further express recognition of its privileges by the Anti-Monopoly Act of 1624.⁸⁶ In 1638 Charles I again renewed its patent, and decreed that it should be entitled to attach all coal exported by ship except through it. Gardiner's pamphlet, the origin of which we shall see later, proves that it continued to exist in 1650. The limitation of competition by the organisation of

producers is again and again the subject of comment. For instance,⁸⁷ “Gentlemen and others in the counties of Northumberland and Durham are prohibited to sell their coals to ships to be transported to London, and all owners of collieries are compelled to sell their coals to them [the magistrates who were identical with the hostmen]. If any shall presume to sell their coals immediately to the ships, they seize upon such coals upon pretence that the owners of the coals are not free of their corporation.... Whereas if the owners of every colliery had free liberty to sell his coals to ships immediately Tinmouth haven would afford two hundred thousand chaldrons of coal in a year more than now are vented, which would reduce the late exorbitant rates of coal in the city of London.”

This apparently refers to the outsiders put down by the Coal Guild, and in whose interests Gardiner spoke. In the great petition laid before a Parliamentary Committee in 1653 he again advocates the liberty of persons hindered by the gild.⁸⁸ The Bill presented to Parliament by the committee in November in 1653 states:⁸⁹ “To the end so useful a commodity as that of sea coal, wherein the poor of this commonwealth are so principally concerned, may come cheaper to the market and the coalowners may not be in a worse condition than the rest of the free people of this realm, be it enacted and ordained that the said coalowners in the respective counties may and have hereby liberty to let or lease of their coal pits and to sell their coals to whom they please, as well to ships as elsewhere, for the benefit of the public. “This Bill, drawn up after hearing evidence, and at the vigorous instigation of the chief witness, Gardiner, never became law. Together with many other projects, it disappeared from the scene on the dissolution of Parliament by Cromwell in 1653.⁹⁰ The scanty documents which survive prove that in 1665 a coal gild no longer existed officially,⁹¹ therefore between that date and the time of the above Bill the abolition of the Coal Guild’s monopoly must have taken place.

The monopolies in the tin mines in the south-west of England were very different from those of the coal trade. In this case, as has been already remarked, monopoly arose from the Crown’s right of pre-emption. At the end of Queen Elizabeth’s reign this right was granted to private persons, and it remained the basis of the monopoly almost without intermission down to the outbreak of the Civil War. The monopoly was owned by capitalists. The capitalist form of the tin industry, as it appears at the end of the sixteenth century, has already been described. The lack of necessary capital had led to the dependence on the capitalist traders of the working mine

owners and smelters, who in their turn employed a number of dependent miners. This process might have come about naturally, without the existence of a monopoly, but the special effect of the latter was to concentrate in the hands of one or more associated capitalists⁹² the entire control of the trade capital, instead of leaving it as at the end of the sixteenth century⁹³ in those of several capitalists.⁹⁴

For some years the tin monopoly was owned by the London Pewterers. They had “general supervision over the manufacture [of pewter] elsewhere in England,”⁹⁵ and it seems quite intelligible therefore that they desired to be independent of the monopolists for their supplies of the raw metal. The simplest way was to take over the monopoly themselves. For that purpose it was necessary to have money, first to acquire the privilege from the Crown, and secondly, because the existing monopolists had made advances to the producers of tin and supplied all their needs, a practice which the Pewterers would have to imitate if they intended to gain control over the raw tin trade. The raising of this capital could not be shifted on to the Pewterers’ Company as a whole, because by no means all the members were rich enough to contribute considerable sums. The only remaining alternative was for the rich members to find the necessary funds. In 1615 twelve members of the company subscribed £7000, to be used, together with £800 contributed by the company as a body, to take over the monopoly for five years. Part of the tin thus acquired was divided (at cost price, plus a certain surcharge) among the working members; the remainder was used for the trade purposes of the richer members.⁹⁶ Thus the finishers belonged at that time for the moment to those whom the monopoly profited instead of to its victims. Their power was shown in the fixing of prices. It seems to have been the policy of the monopolists to offer the tanners economically dependent on them a fixed price, and to screw up the market price on the contrary as high as possible.⁹⁷ The hold which they, as the financiers of the trade, had over the actual working masters enabled them to limit the profits of the latter to the minimum. The effect of this policy on the mining industry itself we shall have to describe later.

While the Crown was able to create a monopoly in tin mining by its right of pre-emption, in the mines of the famous Forest of Dean where no such right existed it adopted another course.

The district, like the stannaries of Devonshire and Cornwall, was one of the few so-called “free mining” regions, in which by virtue of the royal rights of the Crown freedom of mining was the settled tradition. Every “free miner,” that is to say every

member of the mining community, was allowed to pursue the occupation of mining, so long as he complied with the conditions fixed by the community. Under James I this state of affairs was replaced by a special grant of the Crown rights. The Earl of Pembroke obtained in 1612 the exclusive right to extract iron ore and coal in the Forest of Dean. The free miners would not recognise this grant, and were allowed by the Attorney-General to continue their occupation “as an act of grace and clemency, and not of legal right”; the monopolist receiving a right of pre-emption over their output, and no further increase in the number of free miners being allowed. This monopoly was several times renewed. Under Charles I it was held by Sir John Winter, whose privileges were later confirmed by Charles II. Between 1660 and 1670 the earlier rights of the free miners seem to have once more flourished.⁹⁸

Other minerals, the production of which was organised in a monopolist fashion, were alum and salt. In contradistinction to coal and tin, these commodities were not yet generally used in England, and required protection from foreign competition. The output of salt in England was limited until 1670,⁹⁹ in which year salt mines were for the first time worked, to the production of sea salt works. Attempts to develop the trade in the time of Elizabeth had been frustrated by the importation of much better and cheaper salt from Scotland, France, and Spain, which stifled English production. Since the end of the sixteenth century monopolies for salt mining had been granted to particular individuals.¹⁰⁰ They were among the most unpopular of monopolists, and in the Anti-Monopoly Debate of 1601 it was asserted that they had in some places increased the price of a bushel more than tenfold.¹⁰¹ Elizabeth had to annul the grant, and James I dared not renew it. It did not appear again until the time of Charles I. Political reasons had in the years following 1620 reduced the imports of salt to the advantage of the English producers, and when imports again commenced they naturally sought to retain by artificial means the advantages which the Spanish war had given them.¹⁰²

On the ground that “it would be a great benefit for the Kingdome of England and that of Scotland to erect workes for the making of a sufficient quantity of salt and at a certaine moderate price,”¹⁰³ the petitioners obtained (i) the prohibition of the importation of salt from the continent, (ii) the incorporation of a company to conduct the salt manufacture of the east coast from Southampton to Newcastle. Scotch competition the Government sought to defeat by commanding producers in that country to join the new company (Company of Saltmakers of South and North

Shields), on the ground that “a work of this nature should be under one rule and government.”¹⁰⁴ The complaints of the consumers were loud. One of them in 1641 said: “A free trade that is now so much desired of the subject and a settled price desired by the Patentee cannot consist, for a constant price forced upon a native manufacture as a principall part of monopoly.”¹⁰⁵ According to Rogers’ calculation the price of salt, about 13s. 4d. between 1630 and 1635, rose by 1640 to 27s. 4d.; in particular a great difference in price existed between the sphere of the Salt Company and places west of Southampton.¹⁰⁶ The trade was artificially retained by protection and monopoly, although the conditions of production were immeasurably inferior to those obtaining abroad; but it was only when rock salt was discovered that the English salt trade really began to expand successfully.

In its general organisation the alum monopoly, which flourished from 1607 to 1648, resembled very closely the salt monopoly. For our present purposes it will be enough to give its results as they are shown by the excellent investigations of Mr. Price. Here again the industry was most unfavourably placed in England, and could only be built up by the prohibition of imports and the grant of monopolies. As has already been mentioned, very considerable sums, drawn from the pockets of speculative monopolists, who followed one another in fairly quick succession, were spent on its introduction.

The financial results of the “Alum Company” were extremely unsatisfactory, at least for those who would not stoop to underhand practices. The supply sufficed neither for the demand, which had to be met in part by smuggling, nor to cover the costs of working. The average output of alum only amounted, for instance, between 1619 and 1624, to 313 tons a year, whereas to make the enterprise pay a production of 2000 tons was required. Naturally in these circumstances prices were high, and aroused discontent among the clothiers and dyers. The quality of the native product was also considered lower.¹⁰⁷ None of all the monopolies of the seventeenth century, whose nature and peculiarities are known to us, seem to have been more disappointing, alike for producers, for consumers, and for the Crown, though its effects from the economic point of view are not so serious as those of the monopolies in more important commodities.

Glass was another of the monopolies existing in little developed branches of early industrial capitalism. It lasted from 1574, when the Italian Versalini obtained a patent for the production of drinking glasses, to 1642. From 1615 on it was in the

possession of a capitalist courtier, Sir Robert Mansell. As the main condition of his patent was that coal was to be used for the furnaces and not wood, the existing glass manufacturers, who, unlike him, worked with wood, were for Mansell troublesome “outsiders.” On the ground that trees must be protected, he succeeded in securing the prohibition of the use of wood in glass-making, in addition to getting various obstructions and prohibitions imposed upon the importation of foreign goods. The original patent thereby became practically a monopoly of the entire glass industry of the country, and Mansell’s influence was so powerful that he even extorted the exclusion of his monopoly from the provisions of the statute of 1624. The support of the law was given to his privileges by the Privy Council with rigorous severity, and the suppression of all outsiders who did not respect his rights was energetically carried out. Mansell began glass-making on a grand scale at Newcastle, imported many foreign workmen, and certainly put large sums of money into his enterprise. But in 1642 the opponents of his monopoly, who accused it of producing high prices and inferior goods, succeeded by the aid of Parliament in overthrowing it.¹⁰⁸

The history of the salt, alum and glass monopolies, so far as their organisation and growth are concerned, is very simple. In all three we find a new branch of industry of an obviously risky nature, and therefore not particularly likely to arouse lively competition. But in trades long known in the country, in which the power of the monopolists could only be attained after hard struggles with the original producers or afterwards with newly arisen “outsiders,” the history of the monopoly is very different, and shows a series of dramatic catastrophes favouring now one side and now the other. This is most clearly seen in the development of the soap monopoly.

Like so many other monopolies it started with the grant of a patent for a particular process of manufacture. Such a patent was conceded as early as 1622 by James I to two manufacturers, who were the proteges of a courtier. In 1631 several courtiers took over this patent. They swore¹⁰⁹ among other things “to make cheaper and better soap than the soap makers of London “(about twenty citizens up till now the chief manufacturers of soap). By promising the king a high royalty on their output they obtained permission to establish themselves as “The Society of Soapmakers of Westminster,” and further, the right of view of all soap not made by them. This privilege enabled them to cheat the London Soapmakers, but not to overcome them. They next tried to amalgamate with them, “but finding that notwithstanding all endeavours their white soap would not vent according to their expectations, they

laboured to draw the Soap Makers of London to joyne with them, using many persuasions and promises of great profit.”¹¹⁰ When this attempted Cartel failed, another way was suggested, and efforts were made to gain the aid of the civic authorities and the State.

In the presence of highly placed persons and of the Lord Mayor of London an exhibition of washing was given, in which the Society’s soap was found to be better than that of the old London Soapmakers. In vain the latter begged with promises exceeding those of the Society for incorporation and the privileges of the monopolists.¹¹¹ The influence of the monopolists was stronger. Besides the right of search, they had obtained the prohibition of the importation of potash, thereby cutting off their competitors from their supply of raw material, intending themselves, in accordance with their process, to use only native material. A further royal proclamation, forbidding the making of soap from anything but vegetable fats, dealt a mortal blow to the London soap manufacturers who used train oil.¹¹² The rise of new competitors was made subject to the discretion of the Star Chamber, and a special ordinance passed “that outside a circle of one mile round London, Westminster and Bristol” no soap might be made, and that the whole trade should follow the regulations of the Westminster Company.¹¹³

As the opponents of the monopolists did not scruple to break these regulations, prosecutions and lawsuits followed. The result is described later in 1641 by a somewhat partial author in these words:¹¹⁴ “Many Citizens of London were put out of an old trade in which they had been bred all their time and which was their only livelihood, by Knights, Squires and Gentlemen, never bred up to the trade, upon pretence of a Project and New Invention, which in truth was not so, their persecutions of the Soap makers of London in the Star Chamber being beyond example in respect of the manner of proceedings and of the sentence itselfe, who for using fish oyle and not obeying their searchers, were fined at great summes, imprisoned at three several times about twenty months, their goods extended, their Pannes, Fats etc. broken and destroyed, their houses of a great yearly value made unuseful, their families dispersed and necessitated and their estates almost ruined.”

The manufacture of soap by private persons for their own use was also forbidden. But the most important concession gained by the monopolists was acquired in 1634. Their soap was not favoured by the chief consumers, the dyers and wool-combers, and they accordingly obtained the right to use train oil and to apply the old process,¹¹⁵

so that the original patent grew into a monopolist usurpation of the whole trade. A mad policy of increasing prices resulted from this ever-growing monopoly, and kindled the resentment of all consumers. Even the Crown joined in their complaints, perhaps chiefly because the Company neglected to pay the promised royalties. A proclamation of 1634 stated that soap formerly costing 2d. a pound had now risen to from 6d. to 12d. a pound.¹¹⁶

By 1640, however, the position was changed. The old soap-makers succeeded “in buying their trade and their freedom” by promising the Crown larger yearly subsidies than the “Projectors.”¹¹⁷ They in their turn became a corporation, on the condition that they would buy up the Westminster Company.¹¹⁸ The original “outsiders” succeeded, accordingly, to the rights of the adversaries they had so often fought. They appear to have industriously studied the Company’s monopoly system in order to be able to make use of it themselves. We hear that they petitioned for protection, because “many persons did use the making of soap privately and secretly, carrying the same to sale, even to the ruin of the Petitioners,” and that they eventually obtained not only the exclusive right to sell soap, but also the exclusive right to purchase potash, in order to paralyse the “outsiders” who were springing up against them.¹¹⁹ The complaints once so loud against the Westminster monopolists were now re-echoed against those of London.¹²⁰ “These men will have no competitors in their gains, they well knowing by experience how to taste a greater sweetness of gain than the other sope-projectors, having for twenty years together gained much riches by monopolising the Sope boyling mystery into 8 or 10 men’s hands, to the ruine of many a family.”

Although the soap monopoly was one of the most unpopular, it succeeded, as Mr. Price has shown,¹²¹ in maintaining itself even in the anti-monopolist days of the Commonwealth. The monopolists controlled, besides the district in which their operations had commenced, the much contested market of London and Westminster, also other important outlets like Bristol and York. When they were finally abolished is unknown, but it is certain that they were still firmly established in 1657.

The monopolies so far described were created in industries whose capitalist development had already commenced. Another not less important group is to be found in the union of domestic producers of the artisan class with capitalist entrepreneurs. We have already explained that after the end of the sixteenth century a number of crafts had experienced a great need for capital, which led to a division

of the industrial producers into on the one side capitalist masters and entrepreneurs and, on the other independent producers without capital either economically dependent on capitalists or gradually sinking to the position of paid workman. For about a century monopolies exercised an important influence on this development.

It is easy to understand that all who possessed sufficient capital to commence a monopolist undertaking turned towards the craft corporations of the “small masters.” They were already a monopoly, if at first only of a local kind, and the companies of the then centre of trade, London, exercised an extensive influence on all the markets of the country, or could attempt to obtain such an influence by royal ordinance. The incorporation of crafts, though advocated and carried out in the interests of the “small masters,” was also a means by which the capitalist could exploit trade on monopolist lines. The poor craftsman was eager for incorporation, in which he saw protection from further competition; though in fact it only gave the capitalists greater power and control over his interests.¹²²

It was, of course, also possible for the members of a corporation themselves to raise capital by means of common contributions, with the assistance of the public and by special calls on the richer gildsmen. This was, as we saw, in fact done by the pewterers to secure a supply of raw material when the raw tin monopoly was bought. The felt-makers of London adopted a similar system in 1611 to assist poor members of the gild to purchase wool. Such measures, however, appear never to have had a lasting success, owing to financial weakness. A far more successful device was for one or two capitalists to finance the gild, and use the weight of their political influence to obtain the grant of monopolist privileges.

A typical example of this form of organisation is to be found in the pin monopoly. In 1605 the pin-makers became a special corporation. They had not sufficient capital to meet the costs of incorporation, and accordingly they contracted with a courtier to undertake the matter for them in return for a forty years’ subsidy on every 1200 finished pins. As a large number of pins were imported from Holland, the gild’s monopoly was not yet complete. It was necessary to secure protection from foreign competition. Once again capital was required. To obtain from the Government the exclusion of foreign pins was costly, and the craftsmen who wished, after obtaining such exclusion, to extend their production, required considerable sums of money at their command to provide themselves with raw material. A second courtier, Sir Thomas Bartlett, promised to supply the necessary resources out of his own pocket,

and he became much more closely connected with the pin-makers than his predecessor. In November 1616 he bought the latter out for £8000, and took over his claims on the company. He then made an agreement with them, binding himself to deliver to them the necessary raw material, wire, provided that they made over to him at a fixed price all the pins they manufactured. Having thus taken to himself the monopoly of pins, so far as London and the surrounding country was concerned, Sir Thomas attempted to complete it by obtaining the sole right of import. This he acquired in October 1618, though with limitations, which only secured him the monopoly in London and its suburbs, and compelled him to promise a conservative price policy — to use a modern expression. Owing, however, to the lax enforcement of the prohibition of import, an important condition at the base of the agreement between Bartlett and the pin-makers remained unfulfilled. The undertaking failed, and after Bartlett's death pinmaking remained free from such schemes until 1635.¹²³

In that year the pin monopoly arose in a new form. The Company of Pin-makers was re-incorporated and received two important privileges. Imports were strictly forbidden in their favour, and all pin-makers throughout the kingdom were put under the London Company.¹²⁴ The monopoly thus spread beyond local boundaries and was secured in its operation by the company's right of viewing, sealing, and regulating. Its financial organisation was this time undertaken by a Mr. Lydsey, who attempted in the interests of Bartlett's heirs to regain the capital he had lost in the undertaking.¹²⁵

A scheme prepared in 1639 and 1640 in connection with the pin monopoly gives a good example of the operations which the monopolists were prepared to undertake. An attempt was made to amalgamate the pin and the wire monopolies. The wire industry, the introduction and capitalist development of which since 1500 has already been mentioned, had become increasingly monopolist. Fiscal protection, suppression of new enterprises by law, and partial monopolisation of locally limited raw materials (iron, wood, calamin) had for decades given the monopolists a secure position in the industry. Just before 1640 the aforesaid Lydsey had acquired a monopoly in the production of brass wire from the Royal Battery Company, the privileged wire makers. This monopoly it was now intended to strengthen by amalgamation with the pin-makers, and no less a person than Charles I. himself figured as the "promoter." He promised to place £10,000 at the disposal of the pin-makers, in return for which his agent was to buy all their output at a fixed rate agreed to in a list of prices. The

pin-makers on their side were to use only Lydsey's wire, and no iron wire. With Lydsey the king had made a similar fixed agreement. The king, therefore, was attempting to amalgamate in one single monopoly two hitherto separate industries; and the monopolisation of the finished product, in order to obtain a more secure and more profitable market for the raw material, brings to mind exactly the modern trust organisation. When the king gave up the scheme, a capitalist called Halstead is said to have undertaken all his liabilities towards the pin-makers on the one side and Mr. Lydsey on the other. Lydsey, we are told, got back from the profits of the new enterprise part of the capital, according to his own account £7000, which he had put into the pin monopoly. The king failed in his attempt to play the part of financier, because he was himself in want of money. His sole aim was to secure for himself a share in the profits of what seemed a well-conceived undertaking. The outbreak of the Civil War, however, prevented the realisation of the complete scheme.¹²⁶

This perhaps is the best illustration of the relations between craft corporations and capitalist monopolists. But similar cases occurred in various other trades, for instance in the manufacture of finished cloth. The monopoly organised in that trade by the well-known Alderman Cockayne has been recently described in detail by Mr. Price.¹²⁷ Mr. Unwin, whom we have to thank for much light on these events, has shown that a similar development took place in the production of beaver hats. The use of beaver in opposition to felt attracted the attention of several capitalists to the fact that a separate industry distinct from that of felt-makers could be made in corporate form out of it and organised as a monopoly. This scheme was realised in 1638, when the Company of Beaver Makers received the sole right to manufacture beaver hats. As the monopoly grew, it was soon seen that the poorer members of the company, who had formerly made either felt or beaver hats, had fallen on evil days, now that they might only produce the latter. As in other cases we have mentioned, they had not sufficient capital to supply themselves with the large amount of costly raw material that was necessary, if they were to limit themselves exclusively to the manufacture of beaver hats. Accordingly complaints soon arose that the eight capitalists who had been the leading spirits in the matter had, by their economic preponderance, acquired the monopoly of beaver hat making.¹²⁸

Many inferences might be made from the general bearing of the facts so far considered. But the outstanding and fundamental conclusion is that industrial capitalism in England was cradled in monopoly, not in competition. Early industrial

capitalism tended to expand on national lines and similarly its monopolies differ from the monopolist organisation of the craft guilds in not being limited to special areas. There are many reasons for this. Many merely local seats of production owing to natural or economic causes or on account of transport facilities supplied distant parts of the country, so that a monopoly in such a district immediately became a national monopoly, as in the instance of the coal industry of the north, the Cornish tin mines, or such trades as for some reason or other were concentrated in London. Secondly, the expansion of a monopoly over the whole country arose where there was a new industry whose founder had obtained by law, or could acquire by lawful means, the privilege of sole manufacture throughout the whole country, as in the glass monopoly, the salt monopoly, or the wire industry. Finally, the 'nationalisation' of monopoly might result from the affiliation of several local monopolies, especially of craft guilds, or from the control acquired by a particular corporation over other guilds. It was by this method that the London Soap and Pin Makers extended their monopolies over production and markets in all the most important parts of the country.

The essential foundation of all these early national monopolies was the grant of privileges by law to particular persons or corporations and the legal suppression of the unwelcome competition of other producers. Where these means were not sufficient, private agreements could of course also be made. As we saw, the Coal Guild of Newcastle created a system of division of production to restrict competition within the privileged corporation itself. Other forms of association must also be mentioned. In some guilds, as with the Beaver Hat Makers, economic advantage enabled the capitalist masters to gain for themselves a monopoly over the heads of their poorer brethren. In the pin trade, on the contrary, the guild monopoly was carried on by an agreement between the corporation and a courtier till it fell into the hands of a single capitalist. Another kind of association attempted to give the copper wire monopoly the entire manufacture of pins from wire. Private agreements, therefore, played a not inconsiderable part in the formation of monopolies, though secondary to the foundation on privilege. Lastly, foreign trade policy served to increase monopolies. Wherever foreign competition appeared, restrictions of import for the protection of the monopolists, as we have seen, commenced. The importation of such goods as competed with the products of monopolies was hindered by customs duties and prohibitions, and special attempts were made to restrict the importation of raw

material, so as to make competition by any outsiders who might in spite of the prohibitions of the law have arisen, as difficult as possible; witness the prohibition of the import of potash in the case of the soap trade.

Monopoly arose, therefore, in the early days of English industrial capitalism on the support of three chief buttresses, privileges from the Crown, suppression of internal competition by law, and a protective trade policy; it developed further by the aid of private agreements between persons seeking to profit by those privileges, and it was distinguished from the monopolies of the craft guild by the national sphere of its activities. To give an account of the various forms of this organisation was our first duty. The question of the importance to be attributed to these monopolies from the point of view of the industrial and economic development of England during this period leads to the examination of their various effects.

Chapter III. Effects of Monopolies: Their Fall.

The monopolies of the seventeenth century have been generally condemned by almost all the economic writers who from the time of David Hume to the present day have dealt with them.¹²⁹ Mr. Unwin has recently added to the number of such verdicts, though Mr. Hyde Price endeavours to find some favourable results at least in the indirect effects of monopolies.¹³⁰ Possibly it is the general condemnation which these monopolies have met with that has made certain writers find something to praise in the system itself, and to consider only its application and its accidental concomitants disastrous. For instance, the author who describes them in 'Social England' says:¹³¹ "The system of monopolies cannot be regarded simply as a means of raising money without parliamentary sanction, nor merely as a means of enriching favourites, nor as wholly based upon mistaken ideas upon the subject of what we now call Political Economy. It was all these and something more — a provision against real as well as fancied dangers, and in some cases a praiseworthy encouragement of business enterprise and invention. But the British public did not make the needful distinctions."

Professor Cunningham also, though by no means, as Mr. Price seems to believe, a defender of the monopolies, adds to his description of them some remarks on the good intentions and economic ideals of the Stuarts, in which he represents the monopolist system of industry to some extent as a well-meant but unsuccessful experiment.¹³² This point of view seems to me, however, a dangerous one. It is extremely difficult, if not impossible, to decide what in fact the motives of the Crown in granting patents were. It is inconceivable that hidden motives like the enrichment of the king and his favourites were not as weighty as the openly proclaimed aims of engrafting new industries, cheapening production, and improving quality. Which of these motives was the most present in the grant of monopolies, how far the personal wishes of the king where they conflicted with economic reasons gained the victory, and which of the alleged objects were from the beginning only pretexts, it is quite impossible to say. Secondly, even if it could be established that the grant of monopolies was "well meant" on the part of the ruler, and represented an attempt at a national organisation on broad lines, that fact would not help us to an objective

verdict on its practical working. And the elucidation of these practical results is the more necessary, because they almost always turned out differently to what the granters of the monopolies expected, or professed to expect.

It was this discrepancy between actual and expected results which was the constant excuse of the Crown when the wave of popular anti-monopoly movements rose high. Just as to-day many persons regard Cartels and Trusts as a system of organising industry just as advantageous economically if moderately managed, as it is harmful when fully exploited, so in 1601 Queen Elizabeth expressly maintained that she had never given privileges which had in her judgment been “malum in se.”¹³³ In her “golden speech” on the 30th November 1601 she represented herself as the victim of deception, and thanked the Commons for showing her the truth about the monopolies which without their intervention she would never have heard. About forty years later Charles I used exactly similar words when compelled to promise restriction of the monopolies. He explained in 1639 that the privileges which had been given “on pretences that the same would serve the common good and profits of his subjects “ had proved themselves “to be prejudicial and inconvenient to the people,”¹³⁴ the main cause of which had been that the privileges were “notoriously abused.”

The result found most intolerable was the increase in prices, especially when inferior quality went together with higher cost. Nearly all the monopolists had, as we have seen, promised to supply a better quality more cheaply. In no single case was this promise fulfilled. Coal, soap, salt, copper wire, glass and similar articles rose considerably in price under the sway of monopoly. The charter of the Coal Guild of Newcastle set forth the “better disposing of sea coals” as one of the objects of incorporation, but the essence of the later complaints in Cromwell’s time, put forward in the form of a Bill, was that the Coal Guild with the help of the town authorities had greatly obstructed “the free and quick trade of these staple commodities, had made the River [the Tyne] dangerous, and often in many places almost unnavigable,” in order to limit the coal trade to the town of Newcastle alone.¹³⁵ The rise in coal prices during the first half of the seventeenth century must be regarded as proved, although the especially alarming increase about 1640 was due to the political crisis.¹³⁶ Complaints against the sale by the monopolists of bad and unusable coal, already rife at the end of James I’s reign, found renewed expression before the Council of Trade about 1650.¹³⁷ That the rise in the price of soap shortly after the incorporation of the monopolists led to a petition to the Crown itself has

already been related. How bad the soap of the Westminster Company soon became can be seen from the fact that they had to abandon their new process and adopt the old method of manufacture to find a market for their goods. In 1637 the Lords of the Privy Council warned the head of the glass monopoly that “they had found that glass was not so fair, so clear, nor so strong as it used to be.”¹³⁸ In 1601 Parliament was informed by Sir E. Hobby that the price of salt had risen in certain places from 16 pence to 15s. or 16s. a bushel.¹³⁹ Between 1630 and 1640 an equal amount of salt cost £4 15s. to £6 in the area of the monopoly, in other parts of England only £3 or less.¹⁴⁰

Prices of this kind, though made possible by protection and the grant of monopolies, were often the premium necessary for the introduction of new trades. As such they are often defended, or at least lightly judged. But there is room also for scepticism. Historical investigations show that a number of the “new created” or “improved” branches of industry were of very doubtful importance. Professor Cunningham, for instance, finds such an industry in salt mining, begun in England in 1565, for which he thinks “England was very well adapted.”¹⁴¹ But the history of English salt mining in the seventeenth century shows that it could only exist at all under continuous and very extensive protection. When Cromwell removed this protection, it was faced with complete ruin. “The ambition to develop salt and native manufactures by means of monopoly and prohibition of imports resulted only in disappointment,” says Mr. Price.¹⁴² Only when the rock salt deposits were discovered in 1670 did the industry become lasting and successful, while the produce of the sea salt industry, so long nurtured by monopoly, was unable to withstand such competition.¹⁴³ Alum is a further example, as we have already explained, of the negative results of an artificially fostered industry. There are, further, among these monopolies many enterprises which were merely of the nature of passing but expensive experiments. The best instance is the dyed cloth monopoly granted to Alderman Cockayne in 1615. By the aid of a prohibition of the export of “whites,” and the possession of the sole right to trade in coloured cloths, he hoped to transfer the dyed cloth trade to England, an object which had attracted the attention of Sir Walter Raleigh at the beginning of the century. But Cockayne’s cloths were apparently not so good or so cheap as those dyed in Holland, and found no market; and Cockayne was not in a position to carry out his obligations as to the purchase of white cloth.¹⁴⁴ It was clear even in those days that an industry could not be created by merely obtaining an embargo on the export of raw material to other countries. The

Dutch not only forbade and obstructed the importation of dyed cloth from England, but also made attempts to manufacture white cloth themselves by favouring weavers. This in turn limited the market for such white cloth as could not be utilised and sold in England, which the monopolist had received permission to export, while on the other hand he could not look for a larger export trade in his goods because of their inferior value.¹⁴⁵ As a result the whole monopoly was a complete fiasco, and one of the chief industries of England suffered considerable disturbance both in its home market and in its foreign connections. As early as 1617 the privileged company had to abandon its undertaking. A royal proclamation shortly afterwards says:

“We declared our desires to have brought to passe as a principal work of our times the manufactures of dying and dressing of broad cloth within this realm ... but finding that time discovereth many inabilities which cannot at first be seen ... we intend not to insist and stay longer upon specious and faire shows which produce not the fruit our actions do aim at... perceiving that the former grounds proposed to us by the Undertakers of the worke consisted more in hopes than in effects and finding the work itself to bee too great to bee brought to pass in a very short time.”¹⁴⁶ Thus ended the attempt to transfer an industry all the conditions of which were obviously wanting by the grant of a monopoly and by a fiscal policy.

The most essential presupposition to the introduction of finer textile industries, the existence of a qualified class of workmen, was not fulfilled in England at the beginning of the seventeenth century,¹⁴⁷ and this need was only supplied by the later immigration of foreign workers.¹⁴⁸ It was not till fifty years later, and then with far less external stimulus, that this long-desired and afterwards so famous branch of English textiles was successfully introduced as a permanent industry.¹⁴⁹ The cotton industry also, which had already commenced about 1640 in Manchester,¹⁵⁰ has to thank no monopoly for its creation, a fact not to be forgotten as evidence against the alleged “educational” effects of the Stuart economic policy.

James I’s failure in the textile industry was closely paralleled, except that its effect was less widely felt, by Charles I’s attempt to introduce by aid of monopoly a new process in the manufacture of soap, which being in reality less valuable than the existing method was unable to make its way in spite of its monopoly.

The results known to us, therefore, hardly warrant the conclusion that the grant of monopolies was an effective instrument for the introduction of new industries, or that it was the necessary condition for the formation of economically important

productive power, and to a certain extent the needful and successful premium against risk for men embarking on doubtful undertakings. It was not undeveloped but easily fostered branches of production that clamoured for monopoly, but on the contrary the possibility of obtaining protection of this kind which often led to attempts to carry on trades condemned to failure from the beginning by unfavourable economic conditions.

In trades which did not require fostering but were already firmly established, monopoly could not even outwardly profess to be a mere “encouragement.” In such cases it was nothing but a check to a process of development already begun. Nowhere is this more clearly seen than in mining. The Coal Gild in Newcastle with its trade rules hindered the expansion of the production of coal for decades. Many owners, says Gardiner in 1655,¹⁵¹ preferred to let their mines fall into decay rather than making themselves dependent in selling their coal on the gild and the town magistrates. But the best example is in tin mining. As we saw, it was the policy of the monopolists to put down the price as far as they possibly could against the real producers, whom they financed. In 1636 the; Cornish tin miners complained to the king that the mines were falling into neglect, as the expenses were continually increasing, while the price they received for their tin remained stationary.¹⁵² The heavy fall in the figures of production between 1625 and 1646 gives some support to these complaints.¹⁵³ When under Cromwell the monopolist right of pre-emption, which belonged to the Crown, together with the regulation of sales which so hampered the producers, were for about ten years in abeyance, a hitherto unknown spirit of enterprise appeared in tin mining. The producers now had “the freedom to sell at all times and at the best price.”¹⁵⁴ Traders, so we are told,¹⁵⁵ left their profession in large numbers and began to mine tin. “Then it was that the old works which were turned idle many years, before paying the wages of perhaps a hundred men, were now wrought again with advantage, and employed three or four times as many.”¹⁵⁶ In the days of the monopoly the profits of the mine owners and smelters were so regulated by the monopolists, that they were insufficient to attract anyone to devote himself to such a trade. And capitalists above all would be shy of putting their money in a branch of production of whose profits they could only receive a share fixed by a third party.

Even in later days reference was frequently made to the paralysing influence of the monopolists’ policy on mining enterprise.¹⁵⁷ It was even declared that the feeling of

insecurity for many years later predominant in mining was a kind of traditional relic of the bitter experiences gained in the time of the monopoly continuing into the days of free mining:¹⁵⁸ — a singular instance of the irony of fate, when we remember that the special aim of the Stuarts was to guide fresh capital into tin mining by means of the monopoly.¹⁵⁹

The glass industry, so long as it used wood as a firing material, was scattered over all England, and developed rapidly without the protection of monopoly. In 1589 fifteen glass factories are said to have existed, and seven years earlier the Chancellor of the Exchequer had attempted to put a tax on glass factories to counterbalance the waning receipts of the import duties. The desire to produce finer glasses, drinking and cut glasses led to the grant of a monopoly, which ultimately, as we saw, brought with it the suppression of the old wood-burning factories in favour of those that used coal. In consequence the advance of the glass industry was slight, because the monopolists progressed but slowly with their new process. The patent granted in 1574 for the manufacture of Venetian glass became within seventy years, step by step, a monopoly embracing the entire glass production of England. As the monopolists had had continual difficulties in obtaining skilled foreign workmen, or in training English workmen, the families they had suppressed, who were closely connected with the glass makers of Normandy and Lorraine, again entered the trade, and had, in some cases down to the early years of the nineteenth century, a considerable share in its prosperity. The rapid rise of competition after the abolition of the monopoly was typical. In Newcastle a new undertaking sprang up at once in spite of the Civil War. Glass-making spread to other regions, and a writer of the Restoration says that the advance of the glass trade before the Civil War was unimportant compared with its progress during and after the war. At the end of the seventeenth century there were ninety glass works in England, twenty-three of which made the finer kinds of glass. The greater number of these works arose after the Restoration.¹⁶⁰

If to decide how far English industry in fact developed under the regime of protective monopoly during the sixteenth and seventeenth centuries is difficult and at times impossible, to throw out the question how might it have developed without that protection seems at first audacious in the extreme. Yet curiosity is continually posing that question. When one keeps before one's eyes the inglorious history of the industries created by monopolies, how, on the contrary, without monopolies, either

after their abolition or even during their existence, trades arose and continued to live, and how lastly the development of flourishing manufactures was hampered by the monopolies and acquired new life at their fall, the greatest caution cannot blind one to the conclusion that the expansion of England's industrial productivity can only have suffered by the system of monopolies, and that if that system had not been adopted the growth of industrial wealth might certainly have been greater.

In the first place, monopolies led to the promotion of trades which had no possible prospect of being able to exist without them and without all sorts of privileges from the State, for which the monopoly could at no time be regarded as protection during the initial stages only, and which in many directions were a dangerous burden to general economic progress. Secondly, as the system was not limited to new industries, but equally applied to developed industries, the general spirit of enterprise was thereby checked for the advantage of a few monopoly owners, and the development of many industries for which England even then possessed great facilities hampered.¹⁶¹

But even this is not the final condemnation of the effects of monopoly. So far we have considered only the expansion and development of industrial production and the finding of a market for its manufactures. The evil effects of monopoly are most clearly seen in the creation of a particular type of industrial undertaking, which has given a special impress to the original organisation of early industrial capitalism in England as compared with that of later times.

In later days the development of industrial capitalism in all branches of production led to the springing up of numerous competing capitalist manufacturers. But the grant of monopolies caused a concentration of capitalist ascendancy in the hands of a single individual or group of individuals. Take the case of tin mining. The tanners and smelters had become capitalist "masters" as early as the end of the sixteenth century. This process was interrupted by tin mining becoming the monopoly of a few capitalists. The entire control over the tin market rested in the hands of the monopolists, and a further capitalist development followed. Competition among the buyers of the raw product from the independent producers was suppressed, and the mass of sellers found themselves faced by a single buyer who could economically oppress them. Thus it happened that during the first two thirds of the seventeenth century the only period of comparative affluence for the tin miners was the time of the Commonwealth, from 1650 to 1660, when the right of pre-emption and the

limitation of sales to two dates in the year were in abeyance. Once more after a long interval there arose, we are told, a great number of independent miners. The abolition of the monopoly caused a reversal of the process by which owing to a single individual becoming the financier of the entire tin mining trade, capitalism had been carried to a high stage of development. The old movement however soon recommenced, and gradually the capitalist smelters became the economic masters of tin mining, a fact still to be traced to-day according to Lewis in the “apparently unjust business relations between smelter and tinner.”¹⁶²

The intention of the Crown in granting the tin monopoly had been, in addition to many other motives, to secure a fixed price for the producers and thereby to improve their position by freeing them from the capitalist tin merchants.¹⁶³ The opposite happened. The dependence of the tin miners on external capital, already for various reasons considerable, was necessarily accentuated by giving capitalists the monopoly. They used their economic vantageground over the penniless miners to keep the price steady, it is true, but so low as to leave the smallest possible surplus for their dependents.

A similar position arose when capitalists became the monopolist financiers of a guild. In pin-making financial control during the days of the monopoly was concentrated in the hands of a single capitalist, and the craft had at once to buy raw material at a fixed price and to deliver pins to the monopolist at a given price. As in several similar cases, the capitalist ascendancy either of the richer masters or of particular traders over the poor craftsmen was succeeded by the exclusive power of the single concessionaire, who did not hesitate, having once acquired the means, to use his position to the utmost in every way. At the beginning of the seventeenth century all limitations on the number of trade apprentices were removed, and in 1617 it was proposed to give every master thirty apprentices, and further, a great number of women and children were employed who had never been apprenticed. “The organisations,” says Mr. Unwin,¹⁶⁴ “which in other cases furnished through their handicraft traditions a protection to the workmen, were dominated in the case of the monopolist companies by the speculative capitalist, who was as little inclined to maintain the best industrial conditions as is the modern shareholder when dealing with unorganised labour.” In the manufacture of beaver hats too, as we related, the monopoly resulted in the repression of the poorer masters by the eight capitalists who financed it.

In the case of newly introduced industries never organised as handicrafts monopoly from the beginning implied the rise of gigantic undertakings, as the monopolists were by the help of protective duties to supply the needs of the whole country. In these capitalistically organised industries the sphere of the enterprise was much further expanded by monopoly than on technical and economic grounds was possible for a single manufacturer. While, for instance, after the abolition of the glass monopoly there arose many separate factories scattered all through England, in the days of Mansell all factories were united in one undertaking. Further, as we have seen, factories using wood had been suppressed at the instigation of the monopolists. England being poor in wood must naturally have lost the small wood-using factories far more rapidly than the forest regions of the Continent, but this suppression all the same gave a further artificial advantage to the large coal-using factory. While in Germany the demands of technical progress for greater capital expenditure led till the end of the eighteenth century in many cases to co-operation in glass founding, leaving the individual glass-makers their independence,¹⁶⁵ in England already at the time of the monopoly a single large capitalist undertaking was omnipotent.

Starch-making, a new industry introduced at the time of Elizabeth, remained, so long as it was a monopoly in the hands of certain patentees, confined to four plants which manufactured for the needs of London and neighbourhood, although these concerns had to replace the entire former imports. When the monopoly of the patentee and of the later company incorporated under James I was abolished, numerous small undertakings sprang up in a very short time, the process of manufacture being obviously well suited to small craftsmen.¹⁶⁶

In the wire trade the works at Tintern in Monmouthshire, dominated the national production. About 1600 one Steere opened a new works at Chilworth in Surrey with workmen he had- enticed from Tintern. A stormy dispute arose, and finally the monopolists had to buy up Steere's works and materials, and find employment for him himself at "reasonable wages."¹⁶⁷

No doubt there were circumstances in mining, in handicrafts and in the new industries which made the growth of capitalist enterprise necessary; but it was due to monopolies that the functions of the numerous capitalists that arose or might have arisen — for instance, capitalist smelters, capitalist masters, capitalist factory owners — were united in single individuals, who were able by their financial importance to gain control of an entire industry. If Prof. Sombart¹⁶⁸ is right in seeing in the

transmutation in our own times of the industrial organisation of large undertakings into a purely financial administration one of the highest stages of capitalist organisation, that stage was already reached by the old monopolies. The possessor of large capital resources was in a position to finance whole industries, either by himself entering into the manufacture, building works and trying new processes, or by merely undertaking the purely financial organisation and management or the placing of the goods on the market.

This possibility of uniting in one hand the financial control of particular industries by obtaining monopolies made early English capitalist industry the happy hunting ground of all who wished to lay out large capital sums to advantage. Such undertakings were in strong contrast to the hazardous ventures of charlatans which sprang up at the end of the seventeenth century in every sphere of English industrial life. These were mere fraudulent "Projects" for the deception of a readily speculative public, but the monopolist companies of the Stuart days were either due to the union of interested traders (coalowners, tin founders) or to the commercial activities of rich and politically influential persons, who hoped to increase their wealth by financing large branches of industry and accordingly bore the risk themselves. That these "large business men" belonged to court circles, and used their political influence and their accumulated wealth for one and the same purpose appears to us by no means remarkable, though it at times struck their Contemporaries as peculiar. When Sir Robert Mansell, hitherto an admiral, renewed his patent for glass-making, the king was amazed¹⁶⁹ "that Robin Mansell, being a seaman, whereby he had won much honour, should fall from water to tamper with fire, which are two contrary elements." Sir Walter Raleigh was, as we have seen, for a time the owner of the tin monopoly. Sir Thomas Bartlett had gained £40,000 in the service of the queen, with which he financed the pin monopoly.¹⁷⁰ A great number of monopolies were given by the Crown "as special favours in place of hard cash "to favourites, retired officials and officers who hoped thereby to increase their wealth or to make use of their privileges to gain riches by the help of capitalists.¹⁷¹ The monopolies in alum, soap, starch, wire, and many other commodities were financed by wealthy courtiers. It is often difficult to recognise the real personality of the "Promoter." The beaver hat monopoly, as we saw, was due to eight capitalists, who decided the great mass of craftsmen to found a separate corporation. But the actual charter was obtained for them by the Earl of Stirling, who spent "a considerable capital" on this company promoting business, and

was to receive therefor a fixed payment out of the tax collected by the company on the sale of every beaver hat.¹⁷²

The type of monopolist varied accordingly in the different industries. In the coal trade, where the monopoly approximated more to a Cartel, it was the mine-owners who united to organise the monopoly. The soap monopoly of the London manufacturers was similar. But in the majority of cases the monopoly was in the hands of one or more big capitalists. Their functions again varied. Some of them appear only as the source of money or political influence, standing behind the scenes of the organisation itself, or interested in it only as shareholders. Others took an active part in the industrial and technical growth and the commercial management of the enterprise, like Sir Thomas Bartlett and Alderman Cockayne. They appear as the directors of new industries or processes, conduct lawsuits and prosecutions, regulate prices, are at pains to influence the commercial policy of the government in their favour and engage workmen from abroad, uniting in their persons the functions of the large manufacturer and those of the organising financier. It was against this kind of monopolist, in whose hands a more or less considerable political power lay and who without regard for the interests of the thousands he injured changed the social, industrial, and fiscal conditions of the country and brought his dominating influence to bear on the most diverse fields of economic life, against the capitalist financier of large industrial monopolies who made himself unequivocally a dictator of national industry, that the anger of the people and of Parliament was chiefly directed in the anti-monopoly movement. Mr. Price¹⁷³ is therefore certainly justified in explaining the continuance of the London soap monopoly even under the Commonwealth by the fact that this monopoly embraced all the original London makers, and so was from the point of view of a democratic government less easily assailable than the monopolies owned in contrast by particular individuals. With a little goodwill the monopoly in this case could be defended as the systematic organisation of the trade; whereas if it had been in the hands of a single individual who through his wealth and political influence had gained control over a trade with which he had no natural connection, that line of argument would from the first carry but little weight.¹⁷⁴

Monopolies had a very decided influence on the early growth of capitalism in English industry, for they increased the power of capital in those industries in which it had gained a footing, and concentrated it in a few hands. In this sense the

opposition to monopolies was a movement against the ascendancy of a capitalist rule artificially stimulated by privilege. In the last few centuries England has several times gone through periods of economic agitation unparalleled in intensity in any other land. Not unfrequently this phenomenon has been due to the exceptional degree attained in England by the economic grievances which caused the conflict, the result being a very heated agitation for their removal. Never was a battle against an existing commercial policy fought with so much bitterness, enthusiasm, and energy as in England in the 'forties, for the very reason that never had a one-sided class policy so threatened the general' weal as did the prevailing system of high corn duties. The same is true in the history of English monopolies. In Germany there was no similar agitation against them, or, at least, owing to the division of the country into numerous small states, it never acquired a single, clearly recognisable character. Generally speaking the German monopolies, whatever may be the reason for it, did not tend to such intense economic consequences as the English, and they did not become important as the instrument of a system of government hated in domestic politics.

In England the system of monopolies was from the beginning the expression of a definite and independent royal policy, pursued with ever-growing eagerness in spite of statutory opposition from the days of Queen Elizabeth, and in a few decades so successfully developed that in almost every important trade national monopolies arose. At first doubtfully, and then ever louder rose the opposition to this policy from the most diverse quarters. At one time enmity was kindled by purely economic results, such as the increased price to consumers, or the restriction of competition which crippled enterprise; at another by the ascendancy of courtiers, the arbitrary evasion of the law by the Crown, or financial mismanagement. As monopolies steadily increased all these streams of opposition met in a single movement, which succeeded in extirpating in England, after a comparatively short but exceptionally effective existence, the monopoly system which in other countries continued to flourish in one form or another for over a century more.

The main centre of the anti-monopoly movement was the House of Commons, which "found the whole nation behind it"¹⁷⁵ on this question. Ever after the days of the great monopoly debates in 1597 and 1601 the House made continual angry protests against monopolies and monopolists. Even in the debate of 1601 the majority of the speakers showed such determined and energetic hostility to monopolies that their defenders, Cecil and Bacon, could not obtain a hearing, and the queen had to

soothe the discontent by formal promises. The Statute of Monopoly in 1624, though in practice ineffective, was a further proof that Parliament desired vigorous measures against the monopolies. When, after the absolute rule of Charles I, Parliament met again in 1640, one of the first things it did was to declare the chief monopolies invalid, and to use its growing power over the Crown for an energetic attack on all industrial privileges. The deep hatred of the Long Parliament for all monopolies is seen in the drastically worded resolution which decisively refused any monopolist a seat in Parliament.¹⁷⁶ On the 21 st of January 1641 four “monopolists” were, in fact, expelled from the House.¹⁷⁷

The speeches delivered on the various occasions on which the Commons occupied themselves with the question show sufficiently clearly the severity with which individuals condemned the monopoly system, and the ardour with which they attacked it.¹⁷⁸ The speeches of 1640 were fomented by an extensive popular movement against monopolies. From all parts of the country petitions reached Parliament for the removal of “grievances,” especially of monopolies.¹⁷⁹ At the end of his fine and impressive description of the monopolies Colepepper could with truth say:¹⁸⁰ “I have echoed to you the cries of the kingdom.” But these oratorical displays are not by any means the only evidence from which we can picture the anti-monopoly movement of the seventeenth century. They are supported by an abundant literature of pamphlets.

The growth of this literature in the seventeenth century is very largely due to the lively discussions on the monopoly question.¹⁸¹ The characters of the numerous pamphlets vary widely. A great number are purely inflammatory. At times they are satirical, intended to put before the people in grotesque shape the evil effects of the monopolies.¹⁸² Just as at the present time the anti-trust agitation in America represents the industrial monopolies in all kinds of humorous allegorical shapes, so we find pictures of the seventeenth century monopolists with the products of the various monopolies as symbols of their activity and with such legends as:

“If any aske, what things these monsters be,
‘Tis a Projector and a Patentee.”¹⁸³

Many of the pamphlets are concerned with the conditions of a single trade alone, and are the appeals to public opinion of consumers or producers oppressed by the monopoly in the industry in question. Instances of this are to be found in the cases

of the wine, soap, and salt monopolies of 1640 to 1650,¹⁸⁴ and especially in the pamphlet on the coal monopoly written in 1655,¹⁸⁵ the importance of which has hitherto been unfortunately not recognised.

The author of this work, Ralph Gardiner of Chirton, was for many years mistakenly identified by posterity with a coiner of the same name, and was only rehabilitated by the investigations of Dr. D. Ross Lietch in 1849.¹⁸⁶ His pamphlet, whose contents we have already had frequent occasion to quote, attacked the monopolist policy of the town of Newcastle, whose bye-laws under its charter were, according to the writer, contrary both to common and statute law. The special object of his attack was, however, the coal monopoly. This, he in one place states,¹⁸⁷ would most certainly have been declared invalid by Parliament in 1640 “if any public spirit had arisen and denounced this great pest which more than any other affects the life of men.” Gardiner hoped himself to kindle in 1653 the agitation which was wanting in 1640.

He had suffered as a brewer in North Shields from the privileges and monopolist control of the town, and became finally a bitter opponent of all monopolies and restrictions on trade. Whether he undertook the fight against Newcastle’s monopolies in revenge for the long time he had lain in prison there, or from unselfish motives, we cannot say. If Parliament had not been dissolved by Cromwell on the 12th of December 1653, Gardiner’s agitation, which had already led to an important enquiry by the Committee of Trade and Corporations, would certainly have been successful. As it was, Newcastle remained unmolested. But Gardiner’s tireless and heroic zeal in attacking the coal monopoly contributed largely to a clearer knowledge of the effect of the coal gilds, and his vehement but well-informed polemic strengthened the movement against monopolies, even though his immediate object, the abolition of the gild, was only in fact realised about 1660.

The agitation, of which pamphlets and Parliamentary reports give us such a lively picture, exercised an influence on public opinion which extended to days in which monopolies had long been abolished. It is a curious thing that down to the present day the English consumer is especially opposed to any kind of industrial monopoly or monopolist amalgamation, and the main origin of this anti-monopolist national conscience is to be found in the anti-monopoly agitation of the seventeenth century. Until the Elizabethan policy of monopolies began, the expression “monopoly” had always been connected with the acute commercial monopoly which we nowadays call a “corner,” and the chief monopolists were merchants who bought up corn and food

supplies. Against such persons the statutes passed by Henry III.¹⁸⁸ and again under Edward VI. against “regraters,” “engrossers,” and “forestallers” were sufficient protection.¹⁸⁹ The condemnation of monopoly in the case of exchange of goods expressed in these statutes was transferred to industrial production when at the end of the sixteenth century it began to show an inclination to such a system. It seemed a matter of course that monopolies were harmful.

Henry Parker states in 1648:¹⁹⁰ “That which seizes too great matters in the hands of too few, and so is in the nature of a monopoly has been always condemned as preventing trade, and held to be injurious to the major part of mankind.” The lawyers tried to define more accurately the effects of monopolies. In a famous lawsuit tried in 1602 the Court found “the evil of the monopoly” to lie chiefly in the fact that “the price of the same wares has increased”; that after the grant of the monopoly “the wares were not so good and serviceable” as before; and that other producers had, through the monopoly, become unable to find work and so put out of the trade.¹⁹¹ This opinion was shared by writers like Misselden and Malynes, who may be called the forerunners of the political economists.¹⁹² Misselden starts that part of his book written in 1622 which deals with trade monopolies with the words: “The parts of a monopoly are twaine. The restraint of the liberty of commerce to some one or few, and the setting of the price at the pleasure of the monopolist to his private benefit and the prejudice of the publicke.”¹⁹³ Other writings of the time also use the expression that the monopolist regulates the price at “his pleasure,” or “as he pleases,”¹⁹⁴ a phrase which Adam Smith appropriated in this connection about 150 years later.¹⁹⁵ Only, Adam Smith had in his mind merely local guild monopolies, and applied to their conduct words used a century earlier for much more extensive trade organisations. The writings of Misselden and Malynes, though as much concerned in attacking privileges of trade and commerce as those of purely industrial monopolies and patents, are important evidence for estimating the anti-monopolist movement of the time. The expression “free trade,” which first appears at the end of the sixteenth century, came to be used indifferently as the watchword against artificial restrictions of trade and commerce by joint-stock companies, colonial companies and municipal corporations, and against the real trade monopolies of the Stuarts. The writings of Parker, Roberts, and Brent, all between 1640–50, show how in the most diverse fields of economic life as it then existed the beginnings of a movement for the abolition of monopolist fetters and the development of free competition were

present.¹⁹⁶ It cannot be doubted that this economic tendency was strongly influenced by experience of the Stuart trade monopolies. On the other hand, writings which attempted to introduce into other fields a freer economic system may in their time have added vigour to the agitation against industrial monopoly.

That agitation can at any rate be regarded as an independent movement by the side of the general tendency to economic freedom if such a tendency is to be regarded in the first half of the seventeenth century as a single entity at all. For economic Liberalism, with its systematic opposition to all restrictions on free competition — whether by the mercantile system or by the trade regulations — was a far later development. The early outburst in particular trades, and the popular character of such a free trade movement as the anti-monopoly agitation, was due to the growing bitterness among the people against the manner in which particular individuals enriched themselves by monopolies. Doubts might exist as to the economic value of a monopolist organisation of industry, just as to-day in America the position of the people with regard to the chief questions of trust building is still undecided. But against individuals who openly exploited the system, unlimited hatred reigned, just as in the United States it is the struggle against the trust magnates, against Rockefeller, Armour, Havemeyer, and similar persons that attracts the populace towards the anti-trust movement. In the seventeenth century the monopolist was in England the publican of the Bible. “Bloodsucker” and “monster” were the popular names for him. And this hatred was deep-rooted among Englishmen even in later days. When, in the second half of the eighteenth century, small farms were concentrated into larger ones, certain opponents of that agricultural development thought the easiest way to discredit it among the people was to compare a large farmer to a monopolist.¹⁹⁷

The popular character which marked the movement against monopolies led to the rapid fall of that special form of industrial organisation in early capitalist England. We have seen that the growing power of Parliament brought about the abolition of many monopolies after 1640, and that the legal foundations on which monopolies had arisen were destroyed in 1689 by the repeal of the royal power of prerogative and by an important alteration in mining law. It was thereafter impossible in principle to obtain exclusive rights from the Crown, as monopolies, even for foreign trade, could only exist if authorised by Act of Parliament.¹⁹⁸ Internal monopolies Parliament would not be persuaded to grant: it held fast by the anti-monopolist principle of

common law and by the provisions of the Statute of Monopolies.

As early as 1690 Parliament gave certain projectors a proof of the hopelessness of their wishes by refusing to grant recognition to a plan for renewing the pin monopoly.¹⁹⁹ Not content with preventing the growth of monopoly by royal privilege, they also expressly opposed private understandings of a monopolist kind between merchants; for instance, in 1711 an Act was passed, especially aimed at all contracts and agreements between coal-owners and others for the monopolisation of coal.²⁰⁰ In the treatment of the newer industries a similar difference is found between the trade policy of Queen Anne and that of the greater part of the seventeenth century. Monopolies were absolutely forbidden. A close student of English economic history of that time writes:²⁰¹ “The whole tendency, both of legislation and parliamentary practice, was to afford stringent protection to infant industries by prohibiting competitive imports from abroad, and at the same time to trust that the founding of several factories of the same kind would provide sufficient safeguards for the consumer by keeping prices low through the resulting competition.”

Important new industries arose in the eighteenth century, in spite of the unwillingness of Parliament to grant their promoters any monopoly protection beyond the usual inventor's patent. In the still youthful silk industry a certain John Lambe, who had studied the throwing of silk in Italy, received a fourteen years' patent in 1717. When this ran out in 1732 his successor strove in vain to obtain its renewal. Instead he received compensation to the tune of £14,000 and a peerage!²⁰² The tinsplate trade, to this day such an important industry in England, arose in the same way at the beginning of the eighteenth century without any protective monopoly.²⁰³

And Parliament, even if it abstained from any grants of monopolies, had other Colbertian means, especially bounties, by which it could encourage and support an industry.²⁰⁴

So far as our knowledge of industrial England in the eighteenth century goes, no national monopoly based on legal privilege any longer existed at the time in any industry. Tucker, in his first essay, and later Adam Smith, whose detestation of monopoly was all-embracing, would certainly have noticed any such abomination. They know, however, only colonial trade monopolies and a few town monopolies, as a special object-lesson in which they both choose the privileges of Butchers.²⁰⁵ To illustrate the attempts of manufacturers to obtain monopolies by law, Adam Smith

could find no other example than a Dutch clothier in Abbéville.²⁰⁶

Undoubtedly the continued existence of craft corporations with exclusive rights in many ways restricted competition. Adam Smith himself experienced its effect in Glasgow when Watt came there to build and sell his steam engines. The corporation of Hammermen refused to allow him to do so, and his projects could only be carried out within the bounds of the University.²⁰⁷ But the case can hardly be characteristic of the general influence of town corporations at that time. This had, at least in the eighteenth century, considerably diminished.²⁰⁸ While at the beginning of the eighteenth century Lord Molesworth still complained of their harmful influence, Tucker could write in 1782:²⁰⁹ “The exclusive Corporations and Companies of Trades in Towns and Cities have at present very little Power of doing mischief compared with that which they formerly had.” More recent investigations have shown that the attenuated rights of these corporations had mostly fallen into abeyance, and that in many trades “the freedom of the corporation need no longer be bought, and the right of view and other means of gild control had entirely ceased at the end of the eighteenth century.”²¹⁰ Authorities on English economic history, like J. E. Thorold Rogers, have expressly insisted that “the old system of gild and freeman production and trade ... was by no means universal, for the great industries of the north were not shackled by these limitations.”²¹¹

Whatever may have been the functions of these monopolist town corporations in the eighteenth century they are essentially distinguished from the monopolies we have hitherto considered by their limitation to a single locality. While the latter could create a national system of capitalistic industry, the town gilds, so far as they were active at all, could only impose monopolist regulations on small masters in a local market, while capitalist trades organised on the commission, or even on the factory system, could settle in towns where gilds were unknown, or in the country.²¹² The growth of transport facilities and the rise of so many centres of industry destroyed, after the end of the seventeenth century, the monopolist position held in certain goods by the chief towns, and especially London, and accordingly the national importance of local monopolist organisations also disappeared. When the London Company of Frame Work Knitters tried to extend their rights beyond their own local sphere of influence to Nottingham, their attempt was not supported by Parliament. They had to allow the ten masters and operatives of Nottingham to escape their tyranny and continue their trade in independence.²¹³ So very different were the monopolist trade

regulations of these corporations from the industrial monopolies of the Stuarts that a High Court Judge, in a celebrated judgment in 1711, denied altogether the monopolist character of such local restrictions on trade.²¹⁴ Though wrong in the abstract, this legal distinction was clearly based on the obvious but far-reaching difference in the economic importance of two systems of trade organisation both clearly forms of monopoly. In any case, no gild regulation could lead to the concentration in the hands of a few privileged persons of the control over capitalist industries working for a national market or even for exportation on a large scale, as would have happened with the Stuart monopoly system.

By the end of the seventeenth century, therefore, the most essential half of Free Trade had been won for English industry. Even though, as Prof. Brentano has excellently shown,²¹⁵ the coming of the modern “industry” as opposed to the handicraft was delayed by antiquated gild regulations, and especially by the Law of Apprentices, this fact only affected the competition between the old and new forms of trade. Within the bounds of industrial capitalism the way was open for competition. No man who wished to put capital into a rising industry found himself hampered by the prior rights of others or by legal decisions restricting competition.

This freedom of trade was won at a time in which English industry and industrial capitalism were in their infancy. Had not the monopoly system so quickly fallen through its excesses and become a standing abomination to the English people, who knows that Parliament in the eighteenth century, in its ardour for the Mercantile System, would not have tried that method of State interference in commercial matters also? It was the part played by Parliament itself in the battle against industrial monopoly which made this impossible. The mighty growth of industrial capitalism in England which began in the eighteenth century and reached its climax in the Industrial Revolution, followed in the train of a previously won freedom of trade.

The difference between capitalist organisation in the seventeenth and eighteenth centuries, as regards liberty of trade, comes out very clearly in the history of industrial monopoly in England. A comparison with the country that has longest known legal restrictions of competition in capitalist industry shows for what a long time the freedom won so early in England was in striking contrast to the organisation of other industrially advancing nations. A short digression on the growth and duration of German monopolist restrictions shall therefore conclude this subject.

Chapter IV. Comparison with German Development.

A few preliminary observations are necessary. In the first place, Germany has never had so uniform a system of monopoly as that existing in England under Elizabeth, James I, and Charles I. The peculiarities of particular trade privileges alone made that impossible. The phenomenon of a prince attempting systematically to unite industry wherever possible in great national monopolies was unknown. The movement towards monopoly started amongst capitalists, and found support partly in the administration of trade by a bureaucracy imbued with "mercantile" principles, partly in the craft guilds, and partly in the mining regulations. The princes did not play the part of eagerly speculative "Promoters" of capitalist undertakings, while personal enrichment and the trade interests of courtiers, so widespread in England, never had a decided influence on the monopolist organisation of German industry. Perhaps just for the reason that these shady sides of the system were unknown, it remained longer in existence than in England and was abolished without leaving such general hatred behind it.

It is hardly necessary to say that in speaking of the monopolist organisation of early capitalism in German industry it is not implied that this organisation always appeared in concrete form. Certain forms of trade monopolies existed, like the privileged companies or the creation of a "staple" of capitalist merchants. But very often the monopolist organisation of industry was only seen in restrictions of some kind set on new enterprises by law, which accordingly put particular merchants in the position of monopolists. When in spite of such provisions competition between existing factories arose, such works might still have a monopoly against subsequent fresh competitors. If in any such cases special organisation further improved the monopolists' position, the importance of their prior rights increased. In any case, however, legal limitations on fresh competition gave monopolist protection to the existing concerns. We must, therefore, take into consideration all laws which introduced such restrictions, even if they did not lead to the grosser forms of English monopolies.

An enquiry into the effect and importance of monopolist organisation on the growth of German economic life would be outside the scope of our present discussion. We

are only concerned to develop a descriptive comparison between the growth of industrial organisation in Germany and England, and to answer the question to what extent the monopolist organisation of early industrial capitalism, the rise and fall of which in England we have described, lasted longer in Germany. To criticise this system would necessitate a very different examination of details than is required for the purpose of this book. It will be enough for the present to give a sufficiently detailed picture of German industrial monopolies to enable us to institute a comparison between their history and the early disappearance of monopoly in England.

In Germany, as in England, mining is an important industry for trade monopolies. Owing to transport advantages certain areas of production had down to the nineteenth century and retain in part even to-day a "natural" monopoly in markets at some distance from them. In such cases restrictions imposed by law on competition were much more effective in creating monopolies than where producers had to compete for a market with other industrial regions. From the latter part of the eighteenth century up to about 1865 mining was especially subject to monopoly where the so-called "Direktionsprinzip" or system of State administration, a characteristic instance of the mercantile theory in mining, obtained. When freedom of mining had been declared by virtue of the rights of the Crown, every person who found specified deposits in any place was entitled to permission to occupy that place as a miner. This grant was regarded as the consequence of the share in mining rights assured him by private law.

This freedom, which could only be limited by the reserved rights of the State, gave considerably greater facilities than had formerly existed for the continued growth of new undertakings. The Prussian Government regarded the threatened competition of many new mines as by no means desirable. Accordingly the royal share of the mining rights was used to retain for the State the power to make regulations which might allow or refuse the creation of new enterprises. A distinction was drawn between the grant of the royal rights, the grant of a mining area, and the exercise of those rights²¹⁶ (in other words, the commencement of an enterprise) and by decisions concerning the last, the competition allowed by the declaration of free mining could again be restricted at will. That was the case in coal mining in Rhenish Westphalia, which, after being up till the end of the eighteenth century of only local importance, became thenceforward a leading branch of German mining. The rich coal deposits in the

neighbourhood of the Ruhr, originally only used by coaldigging peasants, were first systematically mined in the time of Frederick the Great, when the trade was regulated by a mining ordinance, and put under the control of the State department of mines. In the area of the Cleve-Mark mining ordinance the working of coal seams was dependent on the permission of the royal officials. The probability of obtaining such permission could be estimated from instructions issued in May 1783, at the instigation of the Minister von Heinitz to the department of mines in Cleve-Mörs and Mark,²¹⁷ which insist that “No new coal mines shall be opened until the need of them is proved.” The general intention of these instructions, as the wording clearly shows, is to assure a monopoly to the existing mines. “Owing to the many seams which are being worked coal has fallen in price, and one mine takes away the market of the next,” and the object is to secure that “each of the mines can count on a comparatively safe market.” These regulations were renewed in 1821, and continued in principle until the reform of the mining laws in 1865.

How this principle in practice, even as late as the middle of the nineteenth century, hampered the growth of fresh competition is seen in the history of the origin of the “Kölner Bergverein,” which had to wait two and a half years for the formal sanction of its statutes, and finally received it only in 1849, after numerous “doubts” of the authorities about the statutes in their original form had disappeared.²¹⁸ Till after 1860 the authorities clung to the belief, as the explanatory memorandum to the 1865 mining law shows, that a co-operative mining association (Gewerkschaft), and not a limited company, was the most suitable form of mining undertaking.²¹⁹ The difficulties put in the way of every new company are therefore intelligible. But they meant neither more nor less than the artificial restriction of just that form of undertaking to which the future of mining belonged.

While on the left bank of the Rhine, where French mining law obtained, the firm of Haniel acquired, in face of the protests of their competitors, the enormous area of 110 million square metres, official administration on the right bank aimed at maintaining as far as possible equality between the various mines and the continuance of small masters.²²⁰

Monopoly in coal mining did not rest, therefore, on an agreement between producers, who enjoyed and sought to develop special monopolist prerogatives. Its supporters and directors were the government and the administration. They protected existing concerns as far as might be from fresh competitors, and they saved

individual mines from the possibility of mutual competition in the market by fixing a single price for the whole district.²²¹ They even granted a bounty on export in bad times.²²² The aim of the State in organising the monopolist system was no doubt partly to put the miners in a position to bear the heavy taxes laid until 1865 on mining,²²³ and therefore here, as in England, the connection between the grant of monopoly and the interests of public finance can be traced, though naturally in less gross forms.

A similar system of royal right and official administration prevailed since the enactment of the mining regulations of 1769 in the coal mines of Upper Silesia. But the landowners received as compensation a previous, or, as it was later, a coincident right of mining (*Vorbau-Mitbaurecht*) in the case of grants on their land. Some of them received the *jus excludendi alios*:²²⁴ Till 1854 the expression "landowner" was interpreted by the authorities to mean only the few remaining "Dominialherren," in the district of Beuthen the nineteen owners of estates in knights fee (*Rittergut*).²²⁵ Finally, the State had the power, as always where royal rights obtained, to reserve for itself any area it desired by a mere declaration of the mines department. In Silesia, too, royal rights, official administration, privilege of landowners, and reservations by the State tended to restrict new competition, though monopoly did not outwardly appear in so uniform a shape as in Rhenish Westphalia, where the principle of official administration was adopted with greater logical thoroughness.²²⁶ And the extensive speculations in the exploitation of mining land which occurred when in 1854 every landowner received the *Mitbaurecht*²²⁷ shows clearly how the limitation till that date of such rights to owners of "Dominium" had checked the expansion of mining.

In iron mining, which must be considered in close connection with iron smelting, the circumstances were mostly different. Though the latter had been from early times a separate industry, not legally subject to the principle of the Mining Royalties, the unavoidable economic dependence of smelting and forging works on iron ore and wood enabled the owners of land and of mining rights (except where, as in Upper Franconia and Siegerland, they were pushed into the background by the manufacturers), gradually to subject the smelters to their own conditions and provisos.²²⁸ Usually the owner granted a speculator a concession, in return for payment in iron or later money, to dig for iron in a given radius, to build smelting works, or to take a given amount of wood from the forests.²²⁹ Both in this case and

where princely owners of mining rights owned smelting works, fresh competitors found a barrier erected against them from the first. It was imperative, for the sake of securing a fitting income from dues, to save the concessionaire from any new enterprise which might by competition lower his prices.

The connection of landownership with smelting might result in the protection of existing works even where free mining had been declared, as is shown by the history of the Mansfeld copper mines. They received “a patent of freedom” as early as 1671, and in consequence several works sprang up, apparently in complete independence of one another. From time immemorial miners and smelters had enjoyed the right of getting their supplies of coal and wood at very moderate prices from the forests of the Counts of Mansfeld. Production increased, and as the fuel at their disposal became more and more insufficient, the various works made mutual arrangements as to the exact extent to which each might share in the available coal; in fact, the whole smelting industry and its kindred trades was conditioned and regulated in extent by the fixing of the so-called “Firing shares” (Feueranteile). Any new producer had to attempt to secure a share in this fixed amount of fuel, or in other words, to come to an agreement with the “cartel” of existing works. Naturally this fact put very considerable difficulties in the way of fresh competition.²³⁰

Where special grants of mining rights prevailed, competition was entirely out of the question. This system of special grants was chiefly used by princes where mining was considered a particularly hazardous business, entitling those engaged in it to the continuous protection of a monopoly. An instance are the mines at Ilmenau, which the Duke of Weimar attempted about 1780 to rescue from their entirely neglected condition and to restore to prosperity. A new mining association was formed and received the privilege of “taking over at its pleasure, subject to customary notice and sanction, all seams and borders which might thereafter be discovered in that part of the Henneberg mountains belonging to Weimar.” It also received the right of pre-emption over “all wood and coal necessary for mining.”²³¹ In the Rothenburg district and in the Saale region, contrary to the practice in Mansfeld, similar privileges were granted to a single association by the owner of the royalty. Their exclusive right of copper mining was renewed in 1691, and lasted till their indebtedness led about 1670 to the concession being taken over by the State.²³²

In Siegerland the position was very curious until well on in the nineteenth century, though there, too, the law gave protection by monopoly. Mining and smelting were

influenced not by landowners or princes, but by the craft (Zunft).²³³ Abolished in 1806 on the conquest of the principality by the French the craft guild was reformed in 1813, and in 1830 the guild of “smelting and forging works” received anew the royal sanction to the “Smelting and Forging Regulations for Iron and Steel Smelting and Forging in Siegerland.” These regulations show the way in which the transfer to an increasingly capitalist industry of the monopolist institutions of the craft guild was attempted.²³⁴ The law first lays down that no new woodconsuming smelting works shall be set up within the bounds of the principality of Siegen.²³⁵ After this restriction on new works the law goes on to deal with the limitation of smelting days, which had existed for many years to economise coal and water supplies, and now became a means of dividing production between the then new blast furnaces. Excesses over the limit were punished by fines, but smelting or forging days not used could be sold to another works in the same district.

“This provision,” it is stated in the ‘Berggeist’ as late as 1856, “is so often made use of that there exist to-day smelting works that may be in activity the whole year, and forges that are entirely shut down.... Though the forges are temporarily closed, the works receive their regular income by the regularly repeated sale of their forging days.” The possibility of transferring to another the quota of production represented by the number of smelting days opened the way for concentration of the production of each works in this cartel, in fact to a kind of trust organisation. Apart from this fact, these regulations, like official administration in coal mining, were simply the means of protecting small masters against concentration, and naturally delayed the development of large capitalist undertakings. The growing facilities for coal transport (Ruhr- Sieg Railway, 1861) shattered the monopolist position of charcoal-burning works, as the Smelting and Forging Regulations did not apply to coalburners. But this artificially maintained monopoly did not cease to be effective in practice until about 1860, and was only abolished formally in 1865.²³⁶ The English economist, Banfield, travelling in Germany in the ‘forties, was greatly astonished at these trade regulations. “The principle of competition,” he says,²³⁷ “by which so much has been done in Cornwall, is ... altogether rejected.”

It is clear from what has been said that in German mining and smelting in the eighteenth and in some cases till late in the nineteenth century the law hampered competition and led to the monopolist dominion of existing undertakings. The facts that led to this result are various. Official administration produced the most extreme

monopolist organisation, more especially when it was combined with a dislike on the part of the authorities to the new form of undertaking represented by the limited company. Before the declaration of free mining, special grants of State mining rights²³⁸ had had a decidedly monopolist effect, and officialism substituted for a single monopolist a compulsory Cartel of many members. The influence of landowners and the guild organisation of the legally recognised craft corporations combined with the monopolist tendency of the mining rights to restrict the development of competition. The reform of the mining laws between 1850 and 1870 was expected to lead to a general encouragement of capital, and of the hitherto suppressed spirit of enterprise,²³⁹ and nowadays it would be admitted that no slight share in the resulting expansion of mining was due to the era of free trade then inaugurated.²⁴⁰

In trades where there were no craft associations, monopoly depended on the grant of privileges to special factories and manufacturers, a custom which continued till about 1800. Wherever the system of concessions prevailed, the government was guided by the principle that there must be “a demand” for a new undertaking before it could be sanctioned.²⁴¹ As the government itself decided whether such a demand existed or not, this criterion frequently acted as a check to competition. The history of the numerous privileged factories²⁴² offers very many examples of this. The Calw Cloth Company, for instance, had owned since 1774 a factory which rejoiced in the most complete monopolist protection. In 1775 a clothier at Nagold sought permission to start a second cloth factory. His petition was, however, refused, as the company succeeded in persuading the Chamber of Commerce and the government that a factory of this kind would narrow its sphere of business.²⁴³ As in England, in the seventeenth century, infant industries especially received protection, and by exactly the same methods. An excellent instance is to be found in pottery. In Bavaria the heirs of Pfeiffer were granted in 1770 a monopoly by the Markgraf of Ansbach. Forty years later an inventor named Leers petitioned for “the sole privilege of manufacturing china and stoneware, and the prohibition or heavy taxation of all imports from abroad of his wares.” Apparently Leers had not anticipated that official views on the grant of monopolies had changed since 1770, or had hoped to move the government to sanction so extreme a measure of protection by his financial promises. And in fact he obtained quite a sufficiently monopolist position by the promise “that no privilege of setting up a similar factory would be granted without consultation

with the owner (of the monopoly), and without detailed investigation.”²⁴⁴ Equally instructive is the history of the famous porcelain manufacture in the Frankenthal. The founder of the industry, Paul Anton Hannong, had wished to make porcelain in Strassburg, but had been hampered by the monopolist privileges of Vincennes, and when, threatened with the demolition of his furnaces if he continued his trade, had sought salvation in the Palatinate. There he received in 1755 the monopolist advantages he was seeking, the right of exclusive manufacture of porcelain in the Palatinate, the prohibition of the importation of foreign porcelain with temporary provisions as to foreign wares in stock, the right to acquire under compulsory powers land containing porcelain earth, and cheap supplies of wood from public forests.²⁴⁵

As regards early capitalist trades not organised on the factory system, such monopolies as existed were far less uniform and much more complicated. Capitalist financiers (Verleger) mostly traders, capitalist masters, and craftsmen sunk to working for financiers (Verlagsarbeiter) are all to be found. Just as we have seen was the case in England, the State in sanctioning such monopolies aimed at protecting small masters, to secure for whom steady and profitable prices it was thought necessary to protect capitalists by the grant of monopolies.

In the Solingen cutlery trade, which in the sixteenth and especially in the seventeenth century had become a domestic industry financed by capitalists,²⁴⁶ the struggle for monopoly became at the end of the eighteenth century increasingly severe. A remarkable book written in 1777 describes this struggle in detail and with inside knowledge.²⁴⁷ The privileged traders who, in spite of all attempts at legal protection, had degraded the small masters to the position of “slavish day labourers,”²⁴⁸ attempted to paralyse the outsiders by aid of the law. The “outsiders” consisted of first the unprivileged traders, and secondly the so-called “finishing” small masters, who possessed sufficient capital to buy raw material and, in contradistinction to the dependent craftsmen who only carried out certain processes, delivered their knives to the traders completely manufactured, or sold them directly themselves.²⁴⁹

In 1777 the privileged traders tried to shake off the troublesome competition by new trade regulations, which forbade (i) the combination of retail trade and manufacture, (ii) the admission of new unprivileged traders, (iii) the giving out by unprivileged traders of raw material to craftsmen, and (iv) the purchase of knives by unprivileged traders from the “finishers,” except at a higher price than that paid by

their privileged brethren. In other words, the “finishers” were to a certain extent compelled to sell to the privileged traders, inasmuch as they were forbidden to trade themselves, and difficulties were put in the way of sale to unprivileged persons. There was worse to come. The privileged traders ceased to buy finished knives. They found it more profitable to have their goods made in separate stages; for finished goods there was a price fixed by law, whereas where each process was separately paid there was no normal rate.²⁵⁰

“The palpable result,” writes the author of the above quoted book,²⁵¹ “is that if a finisher cannot sell the goods which he has made with his own materials either to privileged or unprivileged merchants or abroad, he must either close his works or become dependent on the privileged merchants who secured the exclusion of the unprivileged from manufacturing under the New Regulations, and accept from them the raw materials which he formerly bought himself considerably cheaper, and, like every other downtrodden day labourer, gain his scanty daily bread by piece-work. This way lies slavery, as certain a concomitant of the monopoly gained by the privileged traders under the New Regulations as light is of fire.”

The argument that by reducing ruinous competition prices can be kept, to the advantage of the dependent craftsman, from a “fall,”²⁵² was again and again used by the privileged traders in support of their monopolist aspirations. A similar motive was alleged in another early capitalist industry, the iron wire trade of Altena, where the traders and the capitalist “Reidemeister” (wiremasters) formed a monopolist organisation. Unlike Solingen, capital and trading were not actually united in the hands of one class, but the capitalist (and mutually competing) “Reidemeister” were closely dependent on the merchants.

Early in 1662 the Elector’s Vice-Chancellor Diest suggested a recipe for alleviating the depressed producers, which was often used in similar cases: — that the retailers should be given a monopoly, and be obliged in return to take all wire at fixed prices. At the time this scheme proved impracticable, but after 1700 it was fully realised in the so-called “staple.” Just as about 1700 the London felt-makers had engineered a project of making themselves more independent of the middlemen haberdashers by establishing a common place of sale with monopolist privileges,²⁵³ so the “Carding Wire Staple of Iserlohn,” “the Iron Wire Staple of Altena,” and the “Steel Wire Staple” united the interests of the merchant and the maker by means of a single market. Contrary to what happened at Solingen, a well-established monopoly

organisation arose. The details of the organisation changed, but its constant fundamental principle was that the staple company should be in a position to pay producers a higher price by the deliberate suppression of over-production and mutual competition and by the possession of a monopoly. The organisations based on this principle, which have been recently described in detail by Knapmann, could, however, only exist by means of trade privileges, and all such staple companies are accordingly of the compulsory type. For instance, even in the first carding wire staple of 1720, any person who did not sell his entire produce to the staple was threatened with imprisonment, and similar provisions were also usual later. Further, once formed the staple companies became the only legal source of supply for native merchants. These coercive powers were essential for the successful regulation of prices and division of production, and for the assurance that the provisions relating to individual production, most clearly expressed after 1773 in the Repartitions or allotted quotas, were duly observed. In 1779 the evasion of the Repartitions by means of outside labour was made punishable by heavy penalties and removal from the trade. Further considerable restrictions were set on the rise of fresh competition by trade regulations. In 1767 entry into the iron wire staple was made more difficult, and an ordinance of 1754 limited by statute the number of forges in the steel wire trade to 36, a provision which chiefly benefited the rich "Reidemeister," four of whom controlled more than half the total output.

A clear proof of the importance of these and many similar official measures to the existence of the staple organisation is to be found in the fact that when legal compulsion ceased monopolist associations were unsuccessful. For instance, in 1810 a projected combination in the steel wire trade could not be carried out because, since freedom of trade had been introduced in 1809, newly risen makers could not be forced to join. Similarly, after 1809 many manufacturers and "Reidemeister" in the iron wire trade no longer regarded themselves as bound by the staple, so that here too, after much litigation, the combination was dissolved. State protection of monopoly had become a thing of the past. When in 1810 an attempt was made to re-found the steel wire combination, the government refused sanction and asked: "Is it right to favour an organisation which extorts from its fellow-citizens prices above those which the trade would command naturally?"²⁵⁴

The history of the wire industry in Altena and Iserlohn shows how State limitation of competition could lead to monopolist combination of capitalists employing small

craftsmen, and therein differs from that of the Solingen industry in which the privileged retailers were unable to formulate in the concrete form of a single union based on common interests the advantages they obtained as employers. Besides the staple, i.e., the compulsory cartel or officially regulated association, the monopolist organisation in a handicraft controlled by capitalists might take the form of a capitalist company, differing from a staple much as a trust differs from a cartel. Such an undertaking was the Calw Cloth Trade Company (Zeughandelscompagnie) founded in 1650 as a public trading company. In return for loans of money it had obtained various monopolist privileges from the government, for instance, dyeing privileges (Färberrechte), as they are called in the Clothiers' Regulations of 1686. These privileges restricted the freedom of independent clothiers, i.e., those not employed by the company, and assured it thereby a firmer control over production by making competition in finished goods from this side impossible. They were also aimed against the competition of outside dyers, whose markets were similarly limited by various regulations to the company's advantage. Like the English patentees, the company succeeded in obtaining the exclusive right to supply a number of goods, whose manufacture they introduced from France, and taught to the clothiers dependent on them, claiming on this account the right of a "new discovery." No new trader could enter the district. Within the region affected by the trade regulations the rise of clothiers who might seek to employ their poorer brethren ceased. No member of the company could leave it and set up an independent business. Outside the above region the company tried by means of rights of view and pre-emption to restrict the markets of independent clothiers. Free goods, that is goods not bought from the company, were stamped by them, and this stamp, popularly called a "Voulez-Vous," whether rightly or wrongly, depreciated the value of the goods by the implication that the company had rejected them. Between 1674–1688 attempts were also made in the cloth trade to establish, by means of the "Knappenhaus," a monopolist mart for both buying and selling, for the protection of producers. Clothiers had to bind themselves to deliver all their goods to the "Knappenhaus," which was bound in turn to take them all. Private sale to foreign traders being thus intercepted, the Knappenhaus, in which the company played the chief part, could, by regulating production, balance supply and demand, and at the same time prevent the sale of raw material at low rates to foreign outsiders. Just as the wire interests in Altena created a staple to control the production of raw material, the Calw Cloth Company found in the Knappenhaus a

means of imposing their own conditions on its delivery. When the market ceased to develop after 1686, and the company's influence was directed towards an increasingly heavy reduction in the amount of goods produced, the general opposition of the clothiers brought the Knappenhaus to an end. But other trade regulations remained, which tended to reduce to the company's advantage the production of raw material; for instance, the guild regulations which tried to check overproduction of cloth by putting restrictions on the younger men, by making it hard to become a master, and by decreasing the number of apprentices.

Nevertheless, all this mass of privileges failed to uphold the monopoly for long. The State had tried to assure the Calw company a monopoly over as large a field as possible in the so-called "Moderations Bezirk"; but it could not protect the company from the rise of the cotton industry, which began after 1750 to spread all over Germany, and whose products entered into close and successful competition with those of Calw. Just as the use of coarse cloth had given the Calw traders certain safe markets, so now Calw in its turn was threatened by cotton goods. The changing circumstances of the market necessarily brought about the fall of the State-supported monopolist organisation. Such an organisation ceased to have any sense from the capitalists' point of view when it could no longer, by suppressing competition, help to exploit the monopoly their goods enjoyed in a market. Though the trade system which gave the Calw company its monopoly had not altered in principle, the company dissolved in 1797. Contrary to what happened in many other cases, the system of "moderations" and the monopolist trade rights came to an end because the interference of the State in matters of production was found unnecessary and even burdensome by the manufacturers just at the moment when their predominance in the market began to wane.²⁵⁵

The examples quoted will serve to show the existence in the eighteenth century, in some cases till late in the nineteenth century, of a monopolist system in the early industrial capitalism of Germany, mainly in mining, smelting, newly founded factories, and in handicrafts controlled by capitalists. The monopolies differ greatly among themselves. Some owe their existence to a system of direct official administration or to mining laws of a monopolist tendency; others to survivals of feudal or trade guild organisation; others again to all kinds of exceptional rights and privileges granted them by the State. In form, too, they vary from the mere monopolist position of one or more competing traders to the compulsory cartel or the

single monopolist undertaking resembling a trust. But the universal characteristic in all cases is the limitation of competition by trade regulation. The history of their rise and fall is no more uniform than was their legal basis. By no means in every case was it reorganisation on free trade lines which led to the downfall of the monopoly; as in the case of the Calw clothiers, a change in the economic foundation of the undertaking might make the continued existence of a monopolist trade system superfluous. The general causes of the decay were the introduction of freedom of trade, the abolition of the privileges of landowners, the repeal of regulations framed by guilds but favouring capitalist employers of craftsmen, the growing distaste of the government for monopolist concessions to particular factories, and the increasing success of the movement for the 'reform of the mining laws.' The gradual union of the German States in a single trade area, which made it impossible to favour producers in the markets of a single State by prohibitive duties, vetoes on imports, export duties or bounties, was likewise opposed to State-protected monopolies; and the development of transport facilities brought to an end the dominant position long held by given areas of production for supplying large markets. It was just in the case where this predominance continued longest, as in mining and in some instances in smelting, that the old trade system of monopoly rights lasted latest.

The great difference between the beginning of freedom of trade in German early capitalism and the abolition of monopolies in England lies in their dates, and in the contrast between a consolidated England and the separate States of Germany. While in the German States the trade regulations restricting free competition continued to a great extent to exist in the eighteenth and nineteenth centuries, and only came to an end by degrees — sometimes quickly, sometimes slowly — England abolished industrial monopolies at a blow at the end of the seventeenth century. In 1775 the Calw Cloth Factory received in Germany a monopoly; the large New Mills Company in Scotland found itself exposed soon after 1700 to the competition of other undertakings, and tried to come to "a good understanding"²⁵⁶ with them. Throughout the first half of the nineteenth century State administration was still hampering the growth of new concerns in Rhenish Westphalian coal mining, and regulating on a uniform plan the competition of the existing collieries. In the north of England, after the downfall of the Coal Guild, coal mining was completely free from all official interference; in fact, the creation of even an entirely private combination of colliery owners was expressly forbidden in 1711 and 1730.²⁵⁷

There remains the important question of the economic effect of these monopolist systems on the growth of early capitalist industry in Germany. That we cannot here answer. Was the protective trade monopoly necessary for the creation of certain industries or of modern forms of industry, or not? Did it, on the contrary, delay development by preventing capitalist competition? If a general answer can be given to these questions, it requires much more extensive examination of facts than we can here undertake. For our purpose, the answer is also not essential. Our object is merely to contrast the history of a specific form of trade organisation, which was abolished in England by the end of the seventeenth century, with that of a similar system in Germany. The contrast is certainly not unimportant, if we desire to form an opinion of the trade system under which the powerful English industries of the eighteenth century arose.

It is remarkable that English political economy at the end of the eighteenth century was not aware of the contrast between the form assumed by capitalist industry in England throughout the eighteenth century, and both that which it had taken in the seventeenth century and that which it was then taking on the Continent. Neither Sir James Stewart nor, as we saw, Adam Smith dealt with the abolition of the former industrial monopolies in England, or in any way drew attention to its importance for the industrial development of their own day and country. Both know only trading monopolies or monopolist civic corporations.²⁵⁸ In the case of Adam Smith this is partly to be explained by the fact that in his observations on industry he mostly has the handicraft system in mind. When he is thinking of wholesale capitalist production no special explanation of competitive trade seems to him necessary. What he says of the introduction of new industries shows this.²⁵⁹ He who introduces such an industry, “the projector,” expects “extraordinary profits,” and, if the project is successful, his gains are in fact at first very great, but “when the trade or practice becomes thoroughly established and well known, the competition reduces them to the level of other trades.” These words were written about the time that the projector, or entrepreneur, was being most vigorously attacked as a monopolist in Germany. Von Justi, for instance, writes:²⁶⁰ “When in a given kind of manufacture or factory there exists only one entrepreneur, the competition and rivalry of many men in one thing, to which the goodness of commodities and the cheapness of prices is due, is wanting. The lack of good and cheap goods is not only harmful at home, but makes it impossible to gain credit abroad.... Entrepreneurs are therefore, from every point of

view, contrary to good principles.” While von Justi hurls the bitterest attacks at privileged entrepreneurs,²⁶¹ and in Germany the organisation of wholesale industry on the basis of free competition was regarded as a much desired reform, to English economists the existence of such a system seemed something quite natural, and they regarded it neither as the remarkable result of a struggle which raged a century before, nor as a special form of industrial organisation, unknown at that time in any other land. They had not the least idea what a rare form of organisation it was.²⁶²

Part II. Free Trade and the Earliest Monopolist Combinations.

Chapter V. The Doctrine of Free Competition.

After the seventeenth century prolonged competitive struggles between numerous manufacturers arose wherever legal monopolies had been abolished, and were regarded as a natural consequence of freedom of trade.²⁶³ On such competition the English Parliament, which in its admiration for Colbert on the one hand opposed all industrial monopolies, and on the other tried to aid industrial progress by bounties, prohibitions of imports, export duties, etc., or by the artificial stimulus of consumption, counted. The same protective measures which had enriched particular individuals or companies under Elizabeth and the early Stuarts were now under the magic influence of competition to benefit whole branches of industry, and, inasmuch as they favoured numerous mutually competing manufacturers, even consumers also. Accordingly the inevitability of competition was always the argument with which the fears of the consumer were soothed whenever, in consequence of the high protection given to an infant industry,²⁶⁴ he thought himself delivered over to the arbitrary dictation of a few monopolist manufacturers.

These views, generally accepted in England after the end of the seventeenth century, prevailed also among the founders of classical political economy at the end of the eighteenth and the beginning of the nineteenth centuries. Very similar terms to those which we have already found in Adam Smith were used later by Malthus: "If a machine was invented in a particular country by the aid of which one man can do the work of ten the possessors of it will of course at first make very unusual profits; but, as soon as the invention is generally known, so much capital will be brought into this new and profitable employment as to make its products greatly exceed both the foreign and domestic demand at the old prices. These prices, therefore, will continue to fall till the stock and labour employed in this direction cease to yield unusual profits."²⁶⁵

Except for legal restrictions on competition by guild regulations and for certain special peculiarities in particular occupations, Adam Smith knew of no circumstances which could prevent the tendency of manufacturers' profits to equalise. Starting from the proposition that industrial production could be increased at will at the same cost, he concluded that when for any reason the profits of a particular industry rose above

the normal level in a country, an immediate increase in undertakings would take place. From this it necessarily followed that agreements between manufacturers to keep up profits must in the end prove ineffective, and that the interest of each manufacturer was best served by free competition. If, on the other hand, profits were reduced to beneath the normal level, Adam Smith assumed that the weaker were crushed out, either losing their capital or investing it elsewhere; so that here again the interest of the stronger was in the competitive struggle.²⁶⁶

It is to be noticed that Adam Smith only identifies the interest of the individual manufacturer with competition where he assumes elasticity of production. Where a restriction of already existing undertakings seems probable, he fully recognises the possibility and the appropriateness of a coalition. As he explains in his lectures: "When a number of butchers have the sole privilege of selling meat, they may agree to make the price what they please."²⁶⁷ In another place he says that "The trades which employ but a small number of hands run most easily into such combinations. Half a dozen wool-combers, perhaps, are necessary to keep a thousand spinners and weavers at work. By combining not to take apprentices, they can not only engross the employment, but... raise the price of their labour much above what is due to the nature of the work."²⁶⁸ Another time he contrasts two competing traders with twenty traders, and says:²⁶⁹ "In the latter case competition would be the greater, and the likelihood of their combining to rise the price the less." It would therefore be wrong to assume that Adam Smith identified competition with the interest of the individual unconditionally. Where he had in mind a limited number of sellers the substitution of combination for competition seemed to him both possible and also in the interests of the traders.²⁷⁰ His later editor, D. Buchanan, vigorously attacked this opinion, seeing in all such remarks of Smith's a desertion of his own doctrine of enlightened selfishness and failing to notice that to make use of coalition instead of competition in Smith's hypothetical case was simply the result of the desire for the greatest possible profit which animated the trader. Against Smith's wise reservation in the case of competition among few traders, Buchanan argued that competition was the strongest of all motives animating traders, and would therefore even in such cases be the only consideration in their minds. He disputes Smith's example of the wool-combers thus:²⁷¹ "Dr. Smith is not aware that if the principle of combination be once admitted it may be turned against the most valuable of his doctrines. But a combination of rival traders is a phenomenon which, until human nature is changed,

will never be exhibited.” In other places²⁷² Buchanan, again in polemic against Adam Smith, formulates more closely the peculiar and invincible desire of “human nature” for competition: “No body of traders ever can frame an effectual combination against the public; as all such engagements are broken by the partial interest of the individual concerned. No trader will keep up his prices for the profit of others; he will always sell when it suits his own convenience, and upon this principle accordingly is founded all this rivalship of trade.” Even where official interference makes the original rise of competition difficult or impossible, as among guilds, Buchanan will not hear of the possibility of the private combination of such privileged workers.

“The same principle of selfishness which prompts them to form the league, prompts them also to break it. Rival traders have no confidence in each other; not two of them will ever act in concert.”²⁷³ M’Culloch was of quite the same opinion. While he, in support of Adam Smith, deduces the impossibility of increasing prices from the law that profits tend to equalise,²⁷⁴ he is, on the other hand, convinced²⁷⁵ that the principle of competition must prove effective even where the number of sellers is limited and no fresh competitors are added. For as soon as a number of traders in combination raise the price above “what is due to the nature of their work,” it would be “in the interest of a large body of the combiners to secede from the combination and throw their goods on the market.”

Therefore one can trust the supply of the most necessary articles to the unfettered competition of a comparatively small body of masters.

While Adam Smith admits combination in the case of a limited number of competitors, his immediate pupils were convinced of the unconditional value of the law of competition and of its necessary application even in such a case. To them competition is the necessary consequence of individual desire for gain, which will sooner or later break down every monopolist combination, even if to the common advantage of the interests concerned.

Not till John Stuart Mill do we find a doubt as to this opinion and a rehabilitation of Smith’s reservations. Mill quotes the experience of municipal gas and water works in the thirties and forties and of the railway companies to show that undertakings may be so large that a very few of them can satisfy the entire demand. To think prices can be kept low by competition between such companies is a mistake.²⁷⁶ “Where competitors are so few, they always agree not to compete. They may run a race of cheapness to ruin a new candidate, but as soon as he has established his footing they

come to terms with him.” He is further of opinion that manufacturers often succeed by all manner of chicanery in compelling new competitors to follow the fixed custom of the trade, and that, similarly, they compel its observation within their own ranks.

It is typical of Mill’s scrupulous treatment of the subject that, in view of the few exceptions that he finds to the law of competition, he disowns the doctrines of individualist economy which assume its ubiquity. The effects of excluding competition had just been exhibited to all beholders in a new field of industrial life, in the erection of large municipal gas and water works and in railways. Combination had conquered one whole sphere of industrial activity. But it was very different with the large manufacturing trades, which had continued after 1800 to develop on former lines. In this sphere of industry competition ruled, as before, without exception. More especially is this true of the most important finished goods of the period. In these trades we find in ever-increasing degree the continually growing number of undertakings and the multiplicity of existing factories, which are nowadays also a general sign of the prevalence of competition.

In 1835, 1313 establishments existed in the wool and worsted spinning trade, an increase of 10 per cent, in four years.²⁷⁷ In 1787 cotton mills numbered 143, in 1835 they were 1070.²⁷⁸ The silk industry, though a late offspring of English textile trades, also showed a rapid increase in the twenties and thirties. Silk factories increased in Manchester and Salford alone from 5 in 1820 to 16 in 1832, and in 1835 the total number of them in England was 231. The total number of wool, cotton, flax, and silk factories increased in the short period from 1835 to 1839 by 1016, 98 of which were not working in the latter year.²⁷⁹ The iron trade had as early as 1791 73 coal-burning furnaces;²⁸⁰ as prices rose, their number increased in five years to 121, and in 1806 Great Britain already contained 233 such furnaces.²⁸¹ The number of furnaces is no very safe guide to the number of undertakings, as even at the end of the eighteenth century many ironmasters owned more than one.²⁸² The large number of undertakings is seen, however, from the fact that in 1806 233 furnaces were divided among 133 works. In 1791 Scotland had possessed only 16 modern (coal) furnaces; in 1850 it had 113, and in England the number had risen to 405.²⁸³ Paper factories numbered several hundreds between 1820–30.²⁸⁴ Copper and brass had become divided, since the eighteenth century, among numerous mutually competing manufacturers, and where the consumers once feared the monopoly of a few works we have the Birmingham makers complaining in 1799 that, owing to the “numerous competitors,”

they could not sell at profitable rates.²⁸⁵ About 1820 these industries, both in Wolverhampton, Birmingham and other places, were given over to an unceasing competitive struggle. Comparatively little capital was required to start a new business, and hundreds of small competitors sprang up beside the big works.²⁸⁶ A similar development took place in other industries — for instance in the glass trade.²⁸⁷

In 1833 a Parliamentary Committee enquired into the state of manufactures, commerce and shipping, and the extensive evidence taken showed that in the manufacturing of finished goods — which alone were, in fact, considered — a vigorous competitive struggle was going on.²⁸⁸ This had produced in the bad years which preceded 1820 such a lowering of prices²⁸⁹ that the profits of most undertakings were exceptionally small, and in some cases no longer covered the cost of production.²⁹⁰ The opinions of the experts heard by the Committee were characteristically expressed by a textile worker:²⁹¹ “We have long considered that part of our grievances was caused by the steam looms and by the competition of foreign manufacturers; but we consider that a very trifling matter in comparison with the home competition that exists among our masters, and till there is some remedy for that we shall never be better.” Employers and workers seemed equally convinced of the oppressive results of competition; but there is no trace throughout the evidence of any united action to restrict or abolish it. Rather in all branches of industry competition was regarded as an evil, as inevitable as it was harmful, and the survivors regarded it as little more than a natural consequence of the struggle for existence that the weaker gradually became entirely submerged. Adam Smith had taken the ruin of such men as a completely natural fact, unimportant compared with all the advantages of the competition he championed. He had in mind the condition of affairs which an expert stated in 1833 to be prevalent in England when he said:²⁹² “I should ascribe to increased competition the misfortunes of many people in England. If too many people run into one line of business, of course the weaker portion must give way.”

The general characteristic of this great industrial expansion in England was, therefore, ever-growing competition. All the variations which close observers like Mill noticed appeared necessarily not as a refutation but at most as a passing exception to the rule. They were important enough to refute the current deduction of competitive trade from the individualist spirit of the manufacturer, but they were not

sufficient to alter essentially the general complexion of industrial organisation. They were in consequence neither fully recognised nor thoroughly investigated.

This is especially true of the monopolist combinations which existed in the various branches of English mining in the eighteenth and the first half of the nineteenth centuries, sometimes for long, sometimes for short periods. It is only recently that these first variations from the competitive type since the establishment of industrial freedom have begun to attract the attention of economists as early examples of the monopolist organisation which is at present gaining increasing control over industry. In their own day they were hardly noticeable exceptions to the general tendencies of contemporary commerce, but we can now see that though they themselves have long since passed away they were the forerunners of modern cartels and trusts. The most important were the combinations in the north of England coal trade.

Chapter VI. Monopolist Combinations in English Mining.

(a) English Coal Cartels in Their Prime.

After the official coal guild of Newcastle was broken up coalowners continued to regulate the sale of coal by private arrangements. In 1665 “a meeting of the several principal traders in coal” was held and came to an agreement as regards production and prices;²⁹³ though, as we have seen, the most vigorous attempts were made by legislation in the next few years to strangle any agreement between mineowners which might result in a monopolist control over the coal trade. The first prohibition of this kind dates from 1711.²⁹⁴ If one may deduce from its contents the state of affairs which it was intended to meet, the agreement of 1665 was not unique, but a common phenomenon in the northern coal trade. The Act, for instance, declares to be “void and illegal” all contracts and agreements, written or oral, between coalowners, etc., aiming at the monopolisation of coal, or the prevention or hindering of any person from buying, loading, shipping, or selling coal. This provision was to come into operation as from the 1st of June 1711,²⁹⁵ and any person who after that date maintained, continued or called into existence an agreement of the aforesaid kind is threatened, with heavy penalties.

It is clear, therefore, that at that time agreements among the Newcastle mineowners were everyday matters. Of the succeeding years we know little. The last known cartel of the earlier eighteenth century dates from 1725.²⁹⁶ It may be assumed that Queen Anne’s Act, renewed in 1730 by George II, did something to hinder the rise of cartels, though Rogers doubts this,²⁹⁷ and *is* of opinion that the experts who stated in evidence given in 1800 that 1771 was the year in which the cartels began, had forgotten the existence of the earlier ones. This assumption is, however, improbable, because there appeared before the Committee of 1800 persons who had been engaged in the northern coal trade, in one case ever since 1755.²⁹⁸ There seems little justification for accusing their memories when we know of no facts, apart from an attempt in 1768,²⁹⁹ which prove the existence of combinations in the years before 1771.

The theory that a combination existed at that time rests on assumptions and probabilities, and against it there is one important fact. The combination of 1771, the

so-called “Limitation of Vends,” was the result of certain competition which had for some considerable time troubled the coalowners. This competition, due to newly discovered mines in the north of England, must have contributed more to prevent the rise of a single organisation of owners than the prohibitions of the law, which, though drastic, could not touch private agreement.

It must also be remembered that the Sunderland coal trade, which only began in 1654, had reached considerable dimensions by 1750. Between 1755 and 1770 a great number of new mines began to be worked, *among* others the famous Denton and Tanfield Moor collieries.³⁰⁰ Finally, the use of steam in mines greatly increased production. After 1756 steam engines, chiefly owing to the efforts of Brown of Throckley, became more and more common in the northern collieries. The technical advances due to them and other innovations of that time “produced a new era, paving the way to the opening of those extensive and valuable collieries below Newcastle in the Wallsend seam, and the deeper collieries upon the river Wear.” This development was regarded with dismay by those who, on the advice of “far-seeing” agents, had acquired mining property, then considered extremely profitable, but now of decreased value. The Ravensworth, Strathmore, and Wortley families had leased such districts as offered in the existing state of technical knowledge a profitable return, hoping thereby to acquire a monopoly, whereas owing to technical progress since 1750 entirely new mining districts now sprang up producing the most excellent coal and more favourably situated for transport. The overproduction caused by these mines seemed bound to lead to a fall in prices, and thereby to the ruin of the older coalowners, who “in their great eagerness to monopolise those districts,” had burdened themselves with “long and costly leases.”³⁰¹ Technical progress and increased production on the one hand and the discovery of larger quantities of coal on the other led to the sudden suspension of the law of diminishing returns in various districts of the northern coal trade — a severe blow to those who, like the old owners, could not profit by its suspension, the more so as the new owners, to gain all they could from the law of increasing returns, worked their mines at the highest pressure.³⁰²

A later writer³⁰³ gives the following description of the competition which long raged between the various mines and which finally led to the cartel: —

“As more collieries were opened below the Tyne bridge, adjacent to the river and the sea, every facility of exportation was increased, both by situation and cheapness.

Hence a rivalry took place between the ancient and the new and improved collieries. The contention between them was long, arduous and mischievous. It was which of them should by whatever means engage and keep possession, of the market and the public supply. The superiority of the new collieries in quality and adjacency to the river was naturally and by the aid of steam engines so great, that the inferior collieries were obliged, in order to keep up competition, to resort to a practice so blameable that nothing can justify it except the plea of self-preservation. It was this, to pass their coals through a screen or sieve, and so separate the round and the large from the small, that they might meet in the market. This practice was a sacrifice of labour and of materials, so that the smallest coals passing through the screen were made worse than useless. The waste was so immense that the labourers were directed from time to time to set fire to the heaps accumulated, in order to rid the ground of an encumbrance. Thus with a known loss they were enabled to meet in the market the superior article. But of this contention, after lasting some years, both parties became weary; they found it prudentially wise to unite in interest, to equalise the price, to regulate the transmission from each colliery and to feed the public at their own prices and according to their own convenience; hence their union became a direct monopoly; it was agreed that the market should be fed, and not glutted.”

The answers of Mr. Thompson to the Committee of 1800 corroborate this description.³⁰⁴ He became in 1768 manager of one of the most important new mines. After some years the profits of the mine were not satisfactory, and he informed the chief coalowners that he “thought it highly expedient that a certain price should be fixed.” The exclusion of competition seemed to him a necessary preliminary to an increase in profits.

At his instigation representatives of the coalowners of Sunderland — who had only ceased to send their coal through Newcastle in 1704³⁰⁵ — met the coalowners of Newcastle. Meetings were summoned and agreements as to prices and other matters made, and these measures were repeated at regular intervals, until in 1771 a permanent union arose, which, though in no way a direct successor to the old gild, must be regarded as a renewal of the organisation which formerly existed in a different industrial system.

For the existence of this association of owners, which lasted with certain interruptions from 1771 to 1844, two preliminary conditions were essential. First, the area of production had to be such that it could be worked on a uniform plan by the

association, without allowing outsiders to develop effective competition, underbid prices and make its decisions useless. Secondly, it was necessary to find a market in which Newcastle was cock of the walk; a market which could be controlled, and in which prices could be dictated because other producers or groups of producers, whether at home or abroad, could not develop any considerable competition. In short, the combine rested on the monopolisation of production and the monopolisation of the market. This latter it achieved in London and its neighbourhood.

As late as 1800 it was shown that no other English coal district could in any way effectively compete in the London market with Newcastle. Besides Durham and Northumberland, Yorkshire, Lancashire, Cumberland and if Westmorland in the north, Nottingham and Derby in the midlands, Shropshire, Somerset and Wales in the west had been important producers of coal³⁰⁶ since 1750, yet even at the end of the century it was only as a makeshift in times of great emergency that the metropolis drew on them for its supplies. The great cost of transport prevented the growth of real competition with the Newcastle trade. The Committee of 1800 declared³⁰⁷ that a great number of coal deposits existed in the midlands and the western counties, “an aid ... against which no legislative Prohibition at present exists, but which nevertheless has been very seldom called to the supply of the London market.” Welsh coal was practically unknown in London. Since 1780 it had been exported in rapidly increasing amounts,³⁰⁸ but only very exceptionally to London, freights from Swansea to London being far higher than those from Newcastle.³⁰⁹ Inland coal was in no better position to compete in the London market. Neither Yorkshire, nor Warwick, nor Derby, nor any of the districts dependent on inland navigation for transport could rival Newcastle. Attempts to bring inland coal to London proved only too often unprofitable.³¹⁰ Though the building of canals had greatly advanced since 1770, it was in no way capable of coping with the regular transport of large quantities of coal. On such canals as existed the water supply was so deficient that frequent interruptions in carriage were necessary,³¹¹ the dues were heavy and appreciably restricted competition with coal transported by sea,³¹² and, finally, inland coal did not at first enjoy in London the repute of the northern coast coal.³¹³ As a result, at the beginning of the nineteenth century it was only when prices were very high that coal came to London by inland transport. We hear for instance in 1801, when coal was exceptionally dear, of a “growing feeling” in favour of bringing coal from the midlands, whereat the northern coalowners were much concerned.³¹⁴

Their fears were, however, superfluous. For some decades their monopoly in the London market remained safe, though about 1820 the limits within which they could extort monopoly profits without attracting a rush of coal from other districts became narrower. The owners in the north attempted, according to an expert's account in 1830, to keep their price always a little under that at which it would pay other districts to compete. Sometimes, however, they miscalculated. In 1828, for instance, a syndicate price was fixed which was apparently too high, for the supply from Scotland, Wales and Yorkshire immediately increased, and the cartel had to lower its price again.³¹⁵ The fact that under certain circumstances competition existed was brought forward by the defenders of the coal cartel to prove that it was not a monopoly³¹⁶ — a somewhat thin argument, but used to-day by supporters of cartels and trusts who point to the number of outsiders and so on. An absolute monopoly the English coal cartel did not possess. But the fact remains that it was, up to a certain point, in a monopolist position; that is to say, so long as it did not screw up the price so high that it became profitable to get supplies from other sources. Up to that price limit (which was rather high) the northern colliers retained their monopoly in London even in the thirties, owing to the far greater cheapness of bringing coal to the market from the north coast. When prices were low inland coal never reached London.³¹⁷ In 1833 and 1834, when coal was exceptionally cheap, only about 6000 tons of inland coal in all were sold, as against over 4,000,000 of "sea" coal in the same two years. How great, even at this time, the share of the northern mines in the London supply was, can be seen from the following table:³¹⁸

Place of Origin.	1832 (Tons)	1833 (Tons)	1834 (Tons)	1835 (Tons)
Sphere of the Coal Cartel				
Newcastle,	456,880	460,848	774,835	534,000
Newcastle, Wallsend,	708,998	599,299	667,538	732,210

Various,	1,195	60	446	367
Small Coal,	10,174	3,583	2,487	744
Total by Sea,	2,139,078	2,010,409	2,078,625	2,298,812
Total from Inland Districts,	10,742	4,395	1,826	1,004

These figures sufficiently show the predominance of the northern coal districts on the Wear, Tyne and Tees in London. Of about 2,300,000 tons of coal transported to London in 1835 they claimed about 2,150,000, while only the very trifling amount of about 1000 tons come from inland.

The peculiar relations of northern coal with the London market thus satisfied one of the necessary conditions for the creation of a mineowners' cartel. This second condition was that the possibility of utilising these special advantages should not be snatched from their grasp by mutual rivalry. If the northern owners were to turn to advantage the monopoly assured to them, subject to a certain high price limit, by the exclusion through natural causes of outside competition, it must not be made valueless by unceasing competition among themselves. To regulate the price of coal to the greatest conceivable profit of the mineowners, no under-bidding and a systematic plan of common control over sales were essential. Without that the attainment of a "fair price," naively defined by an interested witness in 1830,³¹⁹ as "a price a little below what the consumer can get the same article for elsewhere," was impossible. The experience of the years between 1770 and 1840 pointed to the same moral. Where competition between the various mines prevailed, prices showed a tendency to sink to the cost of production. When there was common regulation, prices rose independently of the cost of production to the limit at which considerable importations from other coal districts became probable.

All the numerous cartel agreements made in the northern coal trade after 1771 had therefore one aim, to keep prices in the London market high. For this purpose various measures were adopted at different times. The reasons which prompted the first important agreement, in 1771, we have just seen. In that year for the first time the Tyne and Wear owners consented, after a prolonged period of competition, to a cartel. The agreement was made in secret and its terms were not published, for fear that the existing prohibitions of monopolist "combinations" might be set in motion against it and its members fined.³²⁰ One phenomenon which runs through the history

of all later coal cartels appears already in this very first combination. Special care was taken to ensure, by fixing the price, that mines whose coal was inferior in quality and more expensive to work should obtain profits. In other words, the weaker and the stronger were to be united for their common development. Experience had shown that all mines suffered from competition, but that the chief sufferers, even to the extent of complete ruin, were those who produced the less valuable kinds of coal.³²¹ As the Committee of 1800 found, the mines which had the worst coal often showed the highest working expenses.³²² New shafts cost more to sink, and their situation with regard to the river was less favourable than that of the good mines. The mines with the lowest working costs had also adopted newer machinery and “so reduced the work of men and horses.”³²³ Further, they had better appliances for loading.³²⁴ In the circumstances it is clear that competition between good and bad mines meant a short shrift for the latter. In proportion as it reduced the price of the best coal, it attracted buyers to the kinds which thus became considering their quality the cheapest, and left the poorer kinds to fetch prices which did not cover the high cost of their extraction and transport.³²⁵ To assure profits to the owners of mines worked on less favourable conditions, it was therefore absolutely necessary to restrict the production of the best mines so that it covered only part of the demand. The owners of the better mines could be compensated for this restriction of their production by driving up as high as possible the price of their coal — which in turn profited the poorer owners, for the outlet and price for the inferior coals depended mostly on whether the market was overladen with good coals or could only get them at famine prices. Gardiner already had complained³²⁶ that it was the policy of the Coal Gild to sell bad or even “unmerchantable” coal together with good coal, and nearly 150 years later the same desire to ensure a market and favourable prices for the inferior coal again led to combination in a cartel. The desired object could, in the circumstances we have described, only be attained by fixing a scale of prices graduated according to quality, of course with the highest possible price for each quality. In this way the poorer mines were assured the position given according to the theory of profits to those who produce in the most expensive way, but whose goods are necessary to meet the demand.

An expert who had himself been secretary to the first cartel gave the Committee of 1800 some details of the organisation of the 1771 combination. The mines were classified by the quality of coal they produced, and their sales regulated accordingly.

Five of the best mines received the main share of the total sales for a given time. Two further groups were given a smaller share at lower prices. Usually the prices of the different qualities differed by one shilling a chaldron.³²⁷

Of the cartel of 1786, which was the continuation of the above, we know rather more. The 1771 cartel had collapsed about 1780, and for a few years the market had been open.³²⁸ The price of coal sank, as might be expected, when regulation of production ceased. In Rochester harbour it fell from an average of 27s. in 1780 to an average of 23s. in 1785.³²⁹ Whether it were so low that, as was alleged,³³⁰ a number of mines did not cover their working expenses, can of course not be proved. But it is beyond doubt that about 1785 the northern mines were suffering from over-production and sinking profits.³³¹ This state of affairs led to a renewal of the cartels. They were defended on all sides³³² as the means of “saving many of the Persons interested in Collieries from ruin,” and preventing a further fall of prices and closing down of mines. A cartel was formed in 1786 and 1787, and lasted, with the exception of a few months, for a great number of years. Its organisation was retained by all later coal cartels. Its inner managing committee was called “the Committee of the Coal Trade,”³³³ and the special agreement as to production and prices “the Limitation of Vend.” The terms of this agreement we must now consider.³³⁴

The main part of the agreement related to the share in the production of coal to be given to the colliery districts on the Tyne and Wear respectively. Of the agreed total output three-fifths were to be allotted to the Tyne and two-fifths to the Wear. The prices were fixed on the same method as that of the 1771 cartel. The restrictions on production were various. First, the entire production was fixed yearly by the cartel committee, and the Tyne and the Wear each given their quota accordingly in the proportion of 3 to 2. Next, the amount to be produced by each mine was laid down, each receiving its due share in the fixed quota of the two districts. This yearly quota was called “the basis”; that of the individual mine “the allotment” — the allotment being “according to the Powers of working and other Circumstances attendant upon each respective Colliery.” The yearly basis was fixed according to the results of the previous year’s sales, increased by an estimated allowance for expansion, and the total of each district was divided among the individual mines according to their nature and position. If a mine produced more than its allotted share, a special agreed fine was levied on it. For every chaldron of coal in excess of its allotment it had to pay at the end of the cartel year a fixed sum to the cartel. This was considered by the

members to be “a Sort of Admission of the Collieries, who have vended less than their quantities, into a Participation of the Profits resulting to the Collieries who have exceeded the vends.”³³⁵ But as “the Allowance made... is not equal to the profits resulting to the Collieries exceeding their Vend from that Excess” there remained the fear that, despite the fine, individuals might produce more coal than was desirable in the general interests. Therefore, the above-mentioned inner committee decided the exact monthly delivery of each mine. Each colliery had to send a written statement on the first Wednesday of every month of their deliveries; and in many cases the owner’s agent had to swear to the statement before a magistrate. The committee then fixed a monthly allotment for each mine according to the state of its yearly share. If a mine had produced more than its share allowed, the excess was subtracted from its next monthly allotment; if less, the deficit was added. The mines received notice every month of the condition of their allotments, and the notice was intended as a guide to owners “how much they should vend upon that Basis till the end of the next month.” As the committee exercised great influence on the amounts of fines, the notice must in practice have been a kind of warning, where any considerable irregularity as regards the quota had taken place.³³⁶ Very often also, after 1790, the monthly vend was settled by the committee on consideration of the existing state of the market.³³⁷ This is very clearly seen in some certified copies of letters reprinted by the Parliamentary Committee of 1800. One of them, for instance, says: “The Demand for Coals being much greater than expected, the Committee think it right to give an additional quantity, etc.”

Another letter from the Secretary of the Coal Committee runs as follows:³³⁸

NEWBURN, 24th Nov. 1782.

SIR,

I beg you may vend no more Coals from Flath-worth till after the twelfth of next Month. As you have already sold above 1000 chaldrons this last Fortnight including Thursday and Friday last, there is no doubt that Walbottle³³⁹ will get the Quantity allowed for Five Weeks; if so, you will be a considerable Quantity over your Vend.

I am, Sir,

Your hble. Servt.,

THOS. TAYLOR.

This and similar letters show clearly the active control exercised by the inner

committee of the cartel. The annual meeting settled the total amount of the vends; but all individual sales during the year were decided by the committee, which had an office and a secretary at the common expense.³⁴⁰ The functions of the committee were twofold — first, to regulate the total production according to the position of the market so as to prevent overstocking; and, secondly, to see that the division of production between different mines remained in accordance with the general decision of the annual meeting. The meeting decided the proportion of each mine to the entire produce; the committee saw that that proportion was observed, however much the actual production varied from month to month. Increases or decreases on the total amount were in the same way shared by each mine in proportion to their vend. The division of the total production for the year, and the observance of the fixed ratio throughout the monthly variations of the total, were the most difficult tasks the cartel had to perform.

Inasmuch as the stronger elements, whose coal found at all times a good market, strove to increase their shares, whilst the less favoured opposed such a step, internal conflicts were inevitable. The “superior collieries generally work nearly what the allotted Proportion gives them; but it frequently happens that they are some hundred Chaldrons over such monthly allotted Proportion.”³⁴¹ We never hear this of the inferior collieries. They had very much less interest in increasing production, especially as the fines fixed for exceeding the vend were a much greater burden on their profits than on those of the better mines, a weakness inherent in the joint regulation of the output.

These difficulties often gave occasion to conflicts which threatened the existence of the cartel. In the middle of the nineties the agreement was suspended for some months “owing to some difficulty in the arrangement of Quantities.” In December 1799 the agreement was not renewed³⁴² “in consequence of some collieries which stood on a high basis requesting to be put on a higher.”

But they never led to a prolonged suspension of the cartel,³⁴³ which continued down to 1840, in spite of temporary small conflicts during which both the agreement as to prices and the division of the vend were at various times — for instance in 1829³⁴⁴ — for some months in abeyance. The fall in prices in such cases soon led to a new combination, usually pressed for with especial eagerness by the less favoured mines.³⁴⁵

About 1830 the cartel was faced with a serious danger. Through the opening of the

Stockton and Darlington Railway the colliery district on the river Tees had greatly developed in the last few years, and especially since the railway reached the river's mouth its exports of coal by sea had greatly risen. The Tees mines had remained outside the Tyne and Wear cartel, and were regarded by them "as a rival trade."³⁴⁶ The competition of these important outsiders noticeably depressed prices, especially when the cartel broke up in 1832 and a "fighting trade" began.³⁴⁷ The market price of the best coal sank from 20s. 3d. in November 1832 to 13s. in June 1833.³⁴⁸ Whether the frequently expressed opinion of the 1836 committee that this competition and the fall in prices which accompanied it swallowed up the entire profits of the inferior mines is correct, cannot be decided with certainty. It is beyond doubt that the complaints of the interested persons who represented the position in 1832 and 1833 as entirely ruinous were much exaggerated. We have learnt from experience in our own day that a cartel always depicts the distress in a time of competition in the liveliest colours so as to justify its own existence. But the position of many collieries during the period of open market was clearly much less favourable than it had been under the cartel. Even after 1840, these two years, which had been the only considerable period of competition during seventy years and also the time of the greatest depression known to the coal trade, were remembered with a shudder.³⁴⁹

As before, general competition led to renewed attempts at combination. In July 1833 the colliery owners met and passed a resolution³⁵⁰ "that a general regulation of the coal trade should be entered into." The new cartel, which came into existence in August 1833, was joined on the 1st March 1834 by the mines of the Tees district.³⁵¹ The cartel was therefore more powerful than any of its predecessors. The number of "outsiders" on the Tyne and Wear was negligible: according to an expert estimate their theoretical productive power in 1836 was about 3,600,000 tons³⁵² against 8,100,000 tons in the same districts by the cartel, to which must now be added the mines of the Tees, the majority of which, including all those of importance, had now sought admittance.³⁵³ Generally speaking the constitution of the 1833 cartel differed little from that of the previous cartel. It dealt first with the fixing of the yearly basis for the three large districts of Tyne, Wear and Tees, and for a smaller district which now obtained a basis of its own. The due share of each mine in the total annual production was then decided accordingly. In 1835 the district basis was as follows:³⁵⁴

District.	Basis in Newcastle Chaldrons.
Tyne	939,000
Wear	585,000
Tees	160,000
Hartley, Cowper, Netherton	68,750
Total basis,	1,752,750

A fortnightly regulation of production was substituted for the former monthly one. "The basis," so the chairman of the Newcastle Coal Committee declared,³⁵⁵ "is merely an imaginary quantity; the basis is taken merely to apportion the relative quantities as between the collieries; the coalowners meet once a fortnight or twenty-six times a year, and, according to the price in the London market, the quantity issued, which is to be divided amongst the collieries, is determined." These meetings, in fact, decided on the amount of coal it was desirable to sell, and each district was then informed that in the coming month they might sell so much coal per thousand of their basis. In 1835 this figure varied in various months from 40 to 85 per thousand of the basis. In the whole year the sum of the monthly amounts, *i.e.*, the vend, was to the original basis as 768 to 1000; in other words, the districts were in fact only allowed 76.8 per cent, of the basis.³⁵⁶ The shares of the individual mines were dependent on that of the district, and each mine received monthly its allotted sales in proportion to its share. An exact account was kept, in which excesses and defects were listed as "short" or "over" respectively. Here is an example.³⁵⁷ The basis for April 1836 was fixed at 65 per thousand. Accordingly, of the annual basis of 969,500 chaldrons fixed for the Tyne district, 62,367½ chaldrons might be sold that month. A certain colliery in the district, the Backworth, had been given a yearly vend of 30,000 chaldrons. On the basis of 65 per thousand for April, its share for the month was 1950 chaldrons. As a fact, the 41 cartel mines in the Tyne district showed the following results that month.

Year's basis	Chaldrons. 959,500
Issue, month of April, 65 per 1000	62,367½
Over	1,265

Short	8.227½
Short of total vend for the month	6,962½

Various steps were taken to secure the observance of the shares of production fixed.³⁵⁸ Owners had to appoint a representative for each mine, who was required to have exact knowledge of the financial arrangements of the mine and to be responsible for any infringement of the agreement, either in production or in prices. This representative — usually the agent of the mine — must be known to the Coal Committee and correspond with them in matters of dispute. The Committee were empowered by section 16 of the agreement, “to summon the parties to this agreement, or their agents, to answer any interrogatories, and to produce any documents necessary to enable them to give full effect to this agreement.” Refusal to give the necessary answers was punishable with a prescribed fine. For the special case of excess on the vend, section 23 provided that “any colliery exceeding the issue beyond 100 chaldrons, or 2 per cent, upon the basis to finish a ship, shall forfeit for every chaldron so exceeding 5s., and such excess shall also be deducted from the issue to the colliery for the next month.” To secure the payment of the prescribed penalty, each member of the cartel had to deposit a bill payable at sight to the amount of £20 for every 1000 chaldrons of his basis. This remained in the hands of a Trustee Committee.

To establish this system, which was only a repetition of the former one, was not so difficult. The great difficulty of the cartel was to realise its end, defined by its chairman in 1836³⁵⁹ as “to apportion the vend to the different collieries according to the quality of the coal and the powers of raising that coal.” According to him — and he had over thirty years’ experience of the trade — that had always been the duty undertaken by cartels. There had been but few differences of opinion as to the suitability of the above system. How to carry out the “Limitation of Vend” when once fixed had rarely been a matter of dispute; but with the basis of division it was very different. The fixing of prices and the principle which, while duly considering all interests, would give a “fair” division of the output to each, was the debateable and at times very sore point in the cartels.

Prices had to be fixed, first as regards their maximum, as far as this lay within the control of the cartel; and secondly, as regards the relation between the various qualities of coal. The superior collieries with good coals were less interested in the

differences of prices than in the maximum price for best quality coal. The inferior mines were equally interested in both. All regulation of prices, however, depended on restriction of production. And here, too, there was a double question. To raise the price of all kinds of coal a general limitation of output according to the actual state of the market was necessary; whereas the relative prices of the different coals depended on the supply of each kind of coal available in the market. Whenever the London market was well stocked with the better coals, inferior coal sold badly at low prices, and vice versa. The chief method of regulating the relative prices to the advantage of the poor mines was accordingly to limit, as far as possible, the sale allowed to the good mines.

Within the cartel itself, therefore, individual owners had private interests besides the general interest. The good collieries, always certain of finding buyers, required as large a vend as possible and the mildest penalties for exceeding it. The bad mines, which only seldom exceeded their vend, depended for their existence on the greatest possible restriction being placed on the production of the good mines and on high penalties for excesses. Mr. Brandling rightly told the Committee of 1836³⁶⁰ that “it is the interest of the low-priced collieries to get the high-priced collieries to raise the prices of their coal, because it would enable them to do the same.” But by the side of this common interest in general high prices there were conflicts of the bitterest kind with regard to differences of prices and to the shares of production allotted to individual mines.

The 1833 cartel allowed, as far as might be, for these conflicts, and attempted to produce a greater harmony of interests than had formerly existed. Formerly it had been left to the mineowners themselves³⁶¹ to estimate the capabilities of their mines and the quality of their coals. In future the Committee named certain persons to act as mine-inspectors, to classify the various mines according to their capacities and to report thereon to the Committee. The Committee thus obtained approximately accurate information as to the working expenses and quality of each mine without compelling each owner to betray the condition of his business.³⁶² It then fixed the vend of each mine according to the inspectors’ reports, with the reservation that the whole matter was a subject of negotiation between the coalowners and their Committee.³⁶³ The owners could oppose an allotment; and special provisions were inserted in the above-quoted agreement to meet such cases. Every difference of opinion came before two neutral “referees,” and if they disagreed, a third was named

as “umpire.”³⁶⁴ The remarkable effectiveness of this system was seen in a famous dispute between Lord Durham, Lord Londonderry, and the Hetton Company — a dispute touching three of the most important mines on the Wear.³⁶⁵

Besides this important duty of fixing vends, the cartel had to decide on the amount to be produced each month, and to fix the common standard of prices and the actual prices of each quality of coal. The key to all these problems was the state of the coal market in London. The London wholesale dealers in northern coal had formed a ring or pool, and it was therefore extremely easy to calculate the state of London wholesale prices. Further, there was direct connection between the cartel and the ring in London. Every second Thursday the secretary of the latter sent a report to the Newcastle Coal Committee.³⁶⁶ The Committee, which knew the price of coal at the pit-head and also the cost of freight to London, could at once discover from the London prices the profits derived for the moment by the coal ring from the fluctuating market prices. The price in Newcastle was, however, fixed for a whole year on the basis that the price at the pit-head plus freight to London was just a little under the price at which London could obtain coal from elsewhere. As we have seen, that was the limit within which the cartel could enforce its policy with regard to prices. Having a fixed price, the cartel was not interested in the fluctuations of London prices, so far as their own prices were concerned. But as an expert expressed it:³⁶⁷ “the price in London” was “the only guide for the quantity issued.” As soon as the coal ring’s price rose or exceeded the limit regarded by the cartel as the price in open competition, that was a sign that the ring were pocketing “immoderate” profits and that the London market could consume more coal than before at the old price. Then the monthly vend could be increased. If London prices fell, so that it was feared the cartel price could not be maintained, that was a hint immediately to order a restriction of the amount brought to the pit-head. The secretary of the Committee stated frankly in 1836:³⁶⁸ “If we see by the markets in London that the price in the Pool has exceeded the price we consider to be the fair-average price, which is a price something below what the coals from other districts can be supplied at, we issue a large supply; if it is below that, we consider the supply is more than the demand requires and we diminish it.” In short, the coal cartel was concerned with the fluctuations of price in London, not in order to increase or diminish its own prices, but in order to regulate its production accordingly, and to supply now more now less coal at the same price.

The existence of the London Coal Ring, which dated from about 1770,³⁶⁹ was of great importance to the northern cartel, of which it was often regarded as an extension.³⁷⁰ The more the ring succeeded in times of falling demand in keeping prices relatively high, the less the cartel had to vary its monthly quantities of output. A slump in prices, which would have resulted from open competition among wholesale dealers, would have increased the degree of these variations and possibly made the whole system of a uniform price throughout the year unworkable. When, on the other hand, the demand was keen, competition would leave the buyers liable to the danger that prices would be driven up very rapidly and encourage inland rivals, while the existence of an agreement made it possible to delay the rise sufficiently for the northern combination to hasten to meet the greater demand by increasing their shipments. It was therefore in the interests of the cartel to support the ring.

Until 1830 the law helped the ring by ordaining that every sale of coal in the port of London must take place at the coal market and through “factors.”³⁷¹ As a result, the shipowners sold their cargoes not to the numerous wholesale coal merchants, at this time about 150 in all, but to a small number of factors who had formed a single committee, the so-called Coal Ring. In 1800 there were only 14 factors as against 28 wholesale merchants. The Parliamentary Committee of that year rightly pointed out³⁷² that “Monopoly was created ... by the Exclusion of the Masters and Ship Owners from an Interference in the actual Sale, the Factors dealing only with the Coal Buyers.” This state of affairs received legal sanction by an Act passed in 1807,³⁷³ which made the sale of coal in the port of London dependent on sales on the coal exchange and specified the exact procedure to be followed. Wholesale merchants must enter themselves in the exchange register, and must sign at each sale the factor’s contract book, which showed the officially certified cargoes of the ships.³⁷⁴ Although no special conditions were laid down for becoming a factor, there were only 19 in 1830.³⁷⁵ Each factor made a private bargain with the coal shippers, but they had a common agreement as to the price at which coal was to be offered to the wholesale merchants.³⁷⁶ In comparison with the enormous increase in sales since 1800, the number of factors, who were in London the first buyers, had risen little. The ships’ captains who sold their cargoes at the port found therefore a very small number of buyers — a fact which naturally much increased the power of the ring in its individual bargains. If the shipowners could have bargained direct with the much larger number of wholesale merchants, the greater competition among buyers would

certainly have increased their profits. As it was, unless the factors had been set up by them,³⁷⁷ they had to leave the lion's share of the profit given by the market price over their out-of-pocket expenses (purchase money and freight) more or less to members of the ring

But in 1831 George IV's law granting these privileges to factors was repealed. A new law³⁷⁸ which came into force in 1832 aimed at freeing the coal trade in the port of London from all restrictions, and abolished the obligation to buy shipments through factors. "The trade is open to any parties who choose to attend."³⁷⁹ Legally factors were abolished, but in practice they long survived. The coal cartel took care that the ring continued. As we have seen, it was greatly interested in its existence, which kept prices steadier than could be expected with unrestricted competition. It was now legally possible for any one who wished to buy coal to get it direct from the shippers, and therefore competition with the factors was not out of the question. But the legal possibility of buying coal directly, to the exclusion of the factor, could only be realised, if mineowners or shippers were ready to sell direct. And this was not the case. In paragraph 27 of the cartel's agreement quoted before the members bound themselves "that all the parties to this agreement shall strictly adhere to such regulations as to the sale of coals in London by the coal factors as the united committees shall from time to time agree upon." The gist of its policy was that no member of the cartel should sell direct to merchants, but solely through factors, whether set up for the purpose by the cartel or merely connected with it by business relations. An expert, the colliery owner Mr. Brandling, stated clearly in his evidence in 1836 the attitude of the cartel towards requests for the direct delivery of coal. Even if the buyer promised immediate payment, members of the cartel could not be moved to sell without a factor. "If you were to come to my office," he said, in reply to a member of the Committee,³⁸⁰ "and asked me whether I would sell you coal or not, I should say, Certainly, and my price is so and so, provided that you choose to go to my factor. If you do not choose to go to him, you may buy your coals elsewhere." In such a case there would remain the possibility of buying from an outsider, without employing a factor. And this way out was suggested by another expert, who defended the behaviour of the cartel with less self-possession than Mr. Brandling.³⁸¹ But, as the chairman of the Committee pointed out to him, the number of outsiders was very small, and under severe cross-examination he admitted that most of them had only inferior coal to sell, so that even so the prospects of direct sale were remarkably

small. The ring, therefore, with the aid of the cartel, retained its power in London even when its privileges had been abolished. As before a small number of factors, no greater in 1836 than in 1830,³⁸² ruled the London coal market, each buying cargoes for himself, but offering the coal to the wholesale dealers at a common price.

Even the ring and the resulting restriction of competition among the first buyers does not, however, seem to have produced in all cases the desired degree of steadiness in the London market. A strong east wind or good sea weather might result in a large number of ships reaching London on the same day; and, if their cargoes were immediately delivered to the factors for sale, a fall in price was inevitable.³⁸³ Conversely, unexpected delay might drive prices higher than would be the case with a regular and even supply. As early as 1834 the cartel made an attempt to limit the possibilities of such fluctuations. They appealed to the ring, whose members were partly dependent on the mineowners, to suggest some remedy.³⁸⁴ The factors accordingly adopted a resolution, with which the cartel heartily agreed,³⁸⁵ that only a limited number of cargoes should be sold each day in the port of London, the exact number changing with the market price. Incoming ships were entered in a register, and offered for sale by the factors in turn. The first forty cargoes on the register were to be sold, if the market price of the best coal had reached 21s. a ton on the day before; if it rose above 21s. a ton 50, 60, 70 or more cargoes would be put up for sale on the following days according to the level the price reached. This decision was carried out with scrupulous care. "The Factors," says a report of 1836, "are very strict in keeping to their regulations; and although a fleet of 300 sail should arrive, no more than 40 ships will be offered on any one day if the prices should be below 21s. the previous market-day. The Factors in reality feed the market, so as to keep the prices as near as possible to those fixed by their regulations."

To carry out these measures, the means which we have already noticed were used. If it appeared that a captain or shipowner had sold more cargoes in one day than the decision of the ring allowed, or that he had not observed the rota decided on by the ring, the secretary of the ring reported the fact to the secretary of the cartel. The cartel then boycotted the offending shipper, and this danger was usually quite sufficient to make shipowners and captains observe the ring's regulations.³⁸⁶ But occasional transgressions did occur. The Parliamentary Committee of 1836 discussed one such case. It was shown that in 1835 two ships belonging to a London coal merchant, the "Olive Branch" and the "Lavinia" were boycotted by the cartel, on information sent

by the secretary of the ring, Mr. Scott, to the secretary of the cartel, Mr. Brandling, that the respective captains had infringed the decision of the factors with regard to the order of sale.

The cartel and the ring worked in organised co-operation. The power of the ring kept down the middlemen's profits, and produced the steady prices which the cartel desired, besides keeping prices at the highest possible level, *i.e.*, just under the price of supplies from other sources. The cartel on its side regulated the middlemen's profits of the dealers, by increasing or diminishing the amount of coal offered according to the state of the London market, and so suiting the London price to its own fixed price for the year. The monopoly made this possible.

We see now why the cartel followed the fluctuations of the London demand as regards the quantity it produced only, and did not fix its prices according to those ruling in London. As the London price on the year's average could be so regulated that the middlemen's profits were but moderate, and that considerable fluctuations during the year were avoided, it was far simpler for the managers of the cartel to fix the average price for the year in the north only, and to let the "big" members of the cartel maintain their own London factors if they wished to exclude entirely all middlemen's profits. As far as concerned the cartel as a whole, to fix the price once only meant an important simplification in the functions of the committee; to regulate prices according to those in London would have been more labour than the relatively small loss in middlemen's profits was worth.

The reduction of these profits, whether they went to shippers or factors, was the great advantage which the mineowners gained from the cartel. When competition ruled in the north it was the shipowners and captains who made great profits. Coal was at these times cheap at the mines, and the shippers had the opportunity of buying at a low price and turning to advantage any increase in the London demand. This being so, it is just in periods of competition that we find mineowners themselves owning ships, attracted by the higher profits of transport to take over the vessels in spite of their usual unwillingness to run the risk of carrying freight.³⁸⁷ When, however, cartels were flourishing, large middleman's profits, either by shippers or by factors, were practically impossible. Both shippers and factors were more or less hangers-on to the cartel, which could remain satisfied with fixing a price for the year, and merely used the fluctuations of the London market price to guide it in deciding on its total output.

One last duty remained. To make the poor mines, and especially those which only produced inferior coal, pay, it was not sufficient to maintain a high price for the best coal and to limit the output of the better mines. It was necessary to deal with coals of very differing qualities, the worst of which depended for a market on the difference in price between good and bad coal; and accordingly it was needful to regulate that difference, in other words, to fix the relative position of the prices. The cartel, therefore, regulated on a common plan the year's average price for the various qualities of coal. A similar system had been organised by the cartels of the end of the eighteenth century, and there was no change as regards this in 1830 to 1840. The owners of the best coal fixed their year's price in accordance with the ruling market price, and the remaining owners were asked to conform. Naturally, the influence of the committee as well as that of the impartial umpire was considerable, and the committee's exact knowledge of the mines in the cartel enabled it to see whether the various owners had named a price "corresponding to" the quality of their coal, or whether it required amendment upwards or downwards.³⁸⁸ As a rule the fixing of prices was a matter of less difficulty than the division of production.³⁸⁹

Enough has been said to show that the coal cartel had since 1770 continually tightened the bonds of its organisation, and was by 1835 firmly established. It controlled three large mining districts, except for a few outsiders. Shippers and factors were dependent on it, and gained no larger middlemen's profits than the cartel allowed. Wholesale prices were regulated by fortnightly or monthly fixing of production. Its object was the general increase in the profits of the coal trade, all mines, whether working on favourable conditions or not, to share the advantage equally. To that end, increases or decreases in the total production were divided among the various mines on an agreed basis fixed according to the capabilities of each mine, and mutual competition which might have arisen from the rivalry of different qualities was prevented by agreement as to the relative prices of each quality. Such were the essential functions exercised by the northern coal cartel during its continuance from 1770 to 1840.

The origin and organisation of the cartel might provide many suggestive facts for an estimate of the effects of this combination. We see, for instance, that when there was no cartel, prices fell heavily, and that the cartel served to protect weak mines working under unfavourable conditions. But such results, important as they are, can give but little aid in judging the suitability or unsuitability of the system to its object,

or its advantages and drawbacks. The high prices for which the cartel was attacked were not denied by those who spoke as interested parties. Then, as now, they were justified on the ground that they were no more than would give a “fair” profit and keep the inferior mines from closing down. So argued the chief witnesses before the Parliamentary Committee of 1800.³⁹⁰ The same argument was the answer of the secretary in 1836 to the question what would be the result on owners of suppressing the combination. “It would produce a fighting trade; it would increase the competition, and the immediate effect would be a depreciation on prices. How long that would continue would depend entirely on the effect it would produce on those collieries that were raising their coals at the greatest expense. The public, in the meantime, would certainly get their coals cheaper, but there would be a transfer of the labour and capital from one district to another, which would materially affect the value of property within that district.”³⁹¹

The rise in price, therefore, which the monopoly made possible, was not only admitted, but defended. To test the real value of the defence would necessitate an exact knowledge of how high coal prices must be to cover the working expenses of the least favoured collieries. As in almost every colliery both these expenses and the quality of coal differed, we cannot of course get this information any more than the Committee could. We can only deduce some general conclusions from the large mass of materials which we have considered. It was certainly true that as early as the end of the eighteenth century the cartel had, by increasing prices, helped to keep alive collieries unfavourably situated, owing to the causes we have related. “The Purpose of these Regulations,” says the Report of the Committee in 1800,³⁹² “was answered, the Evils to which they were avowedly directed were remedied, the Depression of Price complained of was removed, and the Dangers apprehended to the inferior Collieries effectually averted.” But even this Committee is driven to the conviction that the level of prices prevailing under the cartel, that is to say, throughout the period from 1771 on, except for a year or so after 1780, had far exceeded the amount justified by the working expenses of the worst mines. Its conclusion³⁹³ was that “the Coals would admit, with just Profit to every Part of the Trade, considerable reduction.”

In 1830 and 1835 the position was similar. The Committee of 1830 state:³⁹⁴ “It is true that the application of Steam Engine and the use of Safety Lamp have enabled the remaining pillars of coal to be worked out of mines which had been heretofore

abandoned; and though coal is thus obtained, which would otherwise have been altogether lost, the process by which these workings are conducted is said to be so costly that they could only be carried on under a high market price.” The law of diminishing returns made high prices a condition of existence for the inferior mines. But here again the question rises; are not the prices driven up above the limits set by the conditions of production in the least favoured mines? The answer of the Parliamentary Report is: “It is evident that the prices respectively given in by the Coalowners as those which under the regulation of the Vend they are willing to take, are not in all cases the lowest which would afford a compensating return, but are the highest which they think they can maintain under the competition to which they are exposed.”

The enquiry of 1836, and indeed the statements of the coalowners themselves, corroborate this view. We have several times already pointed out that it was a principle energetically held and openly admitted by the latter to maintain the price of coal in London as high as was possible without increasing competition from other sources. “That is the point we aim at, and that is the point we consider ourselves justified in aiming at,” the secretary of the cartel declared³⁹⁵ in 1836; and when he was asked, with astonishment, whether that was not the conduct of a monopolist, he replied: “Certainly not. I consider it to be a combination that we are perfectly justified in entering into. It is a combination of the proprietors to keep up the price of their article in the same way as a combination of workmen keep up the price of their property, which is their labour.” By which answer he admitted that it was not consideration for a “fair” profit which decided the policy of the cartel as regards prices, but, on the contrary, consideration for the highest increase in price possible within the bounds of their monopoly.

In view of this fact, it is difficult to defend the cartel’s prices on the ground that their sole aim was the protection of the least favoured mines. For the cartel fixed its prices not according to the amount of the cost of production, or at least not only by this amount, but chiefly with a view to the highest possible price which could be obtained without becoming subject to increased competition from other districts. Its policy could not therefore be justified, even on the assumption that it was desirable in the interests of the mines which produced little profits to obtain a relatively higher price than that obtainable by free competition. Even from this point of view, even considering only the interests of such producers whose working expenses were high,

we cannot escape the conclusion that the tendency of this monopolist combination was to keep prices at the highest conceivable level, whatever the conditions of production might be. The coal cartel must be judged as regards its prices like many of the cartels which flourish at the present day under protective tariffs. Their representatives also often maintain that the prices aimed at are only sufficient to make the worst factories pay, whereas in fact their policy is entirely governed by import prices, and uses the monopoly given by the tariff to maintain the home price above the world's price by the amount of the customs duty.

Even, therefore, if the conduct of the cartels is regarded solely from the standpoint of its own representatives, it must be admitted that the regulation of prices was far more a policy of self-enrichment than of self-preservation. If, in addition to the producers, the great mass of consumers, who had to pay by increased prices the cost of maintaining mines with high working expenses, are also to be considered, what must then be said of the cartel and its effects? The defenders argued on the point:³⁹⁶ "Consumers also profit by the Cartel; for if prices had sunk owing to general competition, the bad mines would not have continued working, and their cessation would have caused a shortness in coal, which would again have driven up the price, far higher than they have been under the regime of the Cartel."

This argument was but poor comfort for the consumer, as the enquiry of 1836 showed only too clearly. As the price in the time of the cartel usually stood at the level at which it would pay to send coal to London from other districts, and indeed often, for instance in 1828, rose above that level, even if the cartel had not existed it could hardly have risen much higher. The pauses in which a free market existed gave, of course, no opportunity to test the correctness of the expectations which the above argument held out. Competition usually lasted only a few months or at most a year, and therefore no mine closed down during such periods; on the contrary, the rivalry resulted in a great increase in production. How mines with poor coal would in the long run have been affected by the fall in prices cannot be proved, because competition always led in a short time to the renewal of the cartel. But even the opponents of the cartel did not deny that the price prevailing in these periods of competition did not in many mines³⁹⁷ cover the cost of production.

It remains to consider the position of mines producing good coal. According to Mr. Brandling's statement, the difference in the cost of production varied from 13–14 shillings a chaldron in some mines to 23 shillings a chaldron in others.³⁹⁸ As in 1836

the best coal sold at 26 shillings on the Tyne, and 28 shillings and 6 pence on the Wear,³⁹⁹ large profits must clearly have been made by mines producing the best coal cheaply. The owner of one such mine, apparently aggrieved by the restrictions of his output, declared that his gains “had risen above the standard of a reasonable profit.” He even protested against the heavy rise of prices and the accompanying restriction of output, because it seemed to him more profitable for his mine to sell larger quantities of coal at lower prices.⁴⁰⁰ Had prices, therefore, fallen to the level at which they stood before the formation of the cartel in 1823, *i.e.*, from 22–23 shillings, only such good coal mines as were worked at the highest cost would have been appreciably affected. Even mines in which the cost of production was moderate would have made a profit. It is true that the coal of some mines never realised ‘more than 15–18 shillings a chaldron even during the existence of the cartel,’⁴⁰¹ and these mines would have been very badly hit by a fall in prices, unless their cost of production was insignificant. But the commission of 1836 established the fact that the productive power of the mines which supplied good coal cheaply was so great that they alone could have completely satisfied the existing demand in free competition. In other words, the diminished production of poor mines might have been made good by the increased production of good mines had the latter not been artificially checked by the Limitation of Vend.

Mr. Buddle, an inspector of mines and an expert, estimated that the possible annual output of the mines controlled by the cartel had increased enormously in the years 1829–1836, that of the mines on the Tyne and the Wear having risen from 5,887,000 tons in 1829 to 8,123,000 tons in 1835. Technical improvements and the sinking of new mines had contributed to this result. But though the theoretical productivity increased, the actual output was smaller. The total amount sold by the cartel on the Tyne as well as the Wear was less in 1835 than in 1830; on the Tees alone, a far less productive district, it was a little higher. Whilst the possible output on the Tyne and the Wear in 1836 was estimated at 8,123,000 tons, the actual sales of the cartel amounted to 3,495,000.⁴⁰² Good quality mines, capable of producing about 150,000 tons annually, received from the cartel an allotment of 110,000 tons.⁴⁰³ Unbiased judges of the conditions of production in the north, such as M. Wood, who had himself been a colliery proprietor, stated⁴⁰⁴ before the Committee that the number of productive mines with good coal was so great and their working expenses so low that they alone could have supplied the market at such prices as would have left them a

profit, while keeping out the poorer qualities of coal entirely.

The arguments used by those interested to justify the cartel policy therefore became more and more threadbare. It was only possible to preserve those mines which either produced poor coal or worked at great expense by a special reduction of the total output, or else by withholding a large part of the best coal from the market. "The first effect then of the regulation is to force an inferior coal on the market, which in a state of competition evidently could not be sent to pay the producer," said one mineowner,⁴⁰⁵ discontented with the price policy of the committee. The old abuses which Ralph Gardiner had attacked so energetically in the middle of the seventeenth century still existed unchanged nearly two hundred years later. The report of the Select Committee of 1836 seemed merely to repeat his complaints in formulating the results of the enquiry as follows:⁴⁰⁶ "The result, therefore, is that at present the great majority of Coal-owners on the Rivers Tyne, Wear and Tees are combined avowedly to limit the supply of Coals to the London Market, so as to raise the Price to the Consumer higher than a Free Trade would command and, also, to force on the Market a larger proportion of inferior Coals at Prices which could not be maintained otherwise than by such a Combination." Whilst, on the one hand, coal was being sold to the English consumer at a higher price to benefit a few mineowners, on the other hand, it was being disposed of abroad at much lower prices. Those pits which were working at a profit, and which were most affected by the limitation of production, naturally sought to equalise matters by disposing of some of their surplus abroad. The cartel did not regulate export, and every mineowner could export as much as he chose. Although the exporter had to be satisfied with lower prices, mineowners who wished to increase their output considered export business the best means of reducing the inconveniences of a low share of home production. It was stated⁴⁰⁷ that coal was often sold for foreign consumption at 4–6 shillings a chaldron less than the price fixed by the cartel for the home trade, and that even at these rates mineowners, whose working expenses were low or moderate, could derive considerable advantage. According to a later Parliamentary report coal from the north of England was actually 40 per cent, cheaper in St. Petersburg than on the Thames.⁴⁰⁸

Consumers were not unnaturally always greatly disturbed whenever a fresh cartel came into being and prices rose again, and naturally the new cartel was often represented as an "illegal monopoly" and so on. The coal cartel in Newcastle was attacked just as the petroleum trust or our coal cartels are attacked at the present day.

In the years 1820–30 consumers everywhere regarded the cartel on the Tyne and Wear as an “illegal coalition.”⁴⁰⁹ Although from 1826 combinations of employers were legal, the common law of England had, from the earliest times, laid down in practice the principle that “contracts in restraint of trade” are illegal. On this ground a suit was provisionally entered in 1793 against the cartel to be tried in York, but in fact it did not ultimately come into court. The enquiries of the Parliamentary Committee of 1836 were partly the result of petitions from the county of Middlesex and the inhabitants of Westminster. The report of the Committee declared that the complaints of the consumers against the existing coal cartel and its monopolist policy were not unfounded. “A question may arise,” the report says, “whether the Coal proprietors by their combining to prevent Coals being brought cheaper to market, do not subject themselves to penalties.”⁴¹⁰ These expressions are cautious enough. No one, in fact, dreamt of prosecuting the cartel for “restraint of trade,” or anything of the kind. Without fear of legal consequences the cartel could now openly show the power which it had had to conceal carefully during the period in which cartels were prohibited. The frankness with which the secretary of the cartel explained its position and its policy in matters of price and production showed clearly how secure the cartel felt itself. It stood more firmly than ever. And yet its collapse was approaching more rapidly than anyone could have thought possible in the prosperous times of the thirties.

(b) Monopolist Combination in Copper Mining at the End of the Eighteenth Century

Before describing the decay of the coal cartel in the north of England another combination must be mentioned which excited much public attention in England at the close of the eighteenth century. In consequence of the increasing number of complaints from merchants and manufacturers in Birmingham concerning the rise in copper, Parliament appointed a Committee in the spring of 1799 to take evidence and to enquire into the existing condition of the copper trade. Tooke’s tables of prices⁴¹¹ show that copper had risen from 84s. a cwt. in 1790 to 109s. in 1795, and to 120s. in 1799. Moreover, in 1799 manufacturers complained that prices for English copper were much lower abroad than at home, and that it was a matter of pressing importance to them to have the customs duty on copper abolished.⁴¹²

The report of the Parliamentary Committee showed not only that a cartel had

existed in copper mining, but also that after the dissolution of the cartel the concentration of firms interested had been sufficiently powerful to continue a kind of monopolist organisation. The expert evidence given before this Committee is the only witness we possess (a few pamphlets excepted) for the existence of these monopolist conditions. The question of combination played so important a part in the enquiry that the whole history of the movement can be reconstructed.

English copper mining began in the last twenty-five years of the seventeenth century with the discovery of copper ore in Cornwall. It increased rapidly in the eighteenth century, and a large manufacture of copper into finished products of high value developed. England soon produced a large quantity of copper goods which previously had been imported from Germany, especially from Nuremberg and from Holland.⁴¹³ One large consumer at the end of the eighteenth century was the Royal Navy,⁴¹⁴ which used copper in increasing quantities for various purposes. In 1784, according to “a German traveller,”⁴¹⁵ the production of fine copper in Cornwall amounted to from 3000 to 4000 tons. It was estimated in 1797–98 (June 30 to June 30) at 5427 tons, whilst in 1790 the total output in England was estimated at about 6500 tons annually.⁴¹⁶ Of course these figures must be taken as approximate only. Their importance lies in the fact that England exported copper annually in large quantities. For instance, the amount of copper sold in 1797 to the East India Company alone was 1500 tons.⁴¹⁷ Thus England had far outstripped Sweden, the only other European country which could be seriously considered as an exporter. The output of copper in Sweden was estimated by experts at from 800 to 1000 tons annually, two-thirds of which was exported.

The export trade of several other European copper-producing countries, such as Russia (Siberia), Prussia (Mansfeld), and Hungary, was beneath consideration.⁴¹⁸ In times of unusual demand the copper mines of Armenia and South America could help the importing countries, but the regular supplies were not obtained from these sources.⁴¹⁹

Although England in the eighteenth century was the largest exporter of copper in the world, yet the English manufacturer had to pay for his material higher prices than those current in the international market. The import price in the continental consuming countries — especially in France in the last decade of the century — was fixed by the competition of the above three exporting regions, especially of Sweden, the most important of them. In England itself competition was restricted by a duty of

eleven guineas a ton on copper. But the evidence in 1799 showed clearly that the English price exceeded considerably not only the export price of copper, but the price at which copper could have been obtained from elsewhere under a system of free imports. When in the middle of the nineties the Government required copper for minting, it made the sad discovery that it could not buy copper at the same price which the East India Company had paid. Later it proposed, in order to supply the navy with copper at a cheap rate, to import copper duty free for Government purposes, and to forbid the export of copper by the East India Company — a clear proof of the great discrepancy between the export and the home price. A Birmingham manufacturer stated that he had in 1788 been able to buy copper in Sweden at £98, which cost in England £105. As the English price was no higher than the Swedish plus freight and duty, it did not pay him to import. Even the figures given by Mr. Grenfell — the expert who advocated the retention of the duties — showed that there was great disparity between the English and the Swedish prices. According to him, the price of one ton of copper in Sweden in 1796 was £110 and in England £118. In the same year the East India Company bought English copper at a contract price of £106 a ton, about £12 cheaper than the home buyer.⁴²⁰

The remarkable fact that in the largest exporting country of the world prices in the home market were relatively so high in spite of rapidly increasing output began to be noticeable from 1790 onwards. Ten years previously the tendency had been exactly the reverse. With an increase in output prices fell steadily. Copper ore had fallen from £73 2s. 6d. a ton in 1784 to £63 8s. in 1790. Before 1771 the East India Company always paid more than; £100 a ton for cake copper. But from this date onwards prices fell steadily, so that in 1781 the company only paid £79. In 1783, in a report, the company expressed its satisfaction that, “notwithstanding the Increase in the demand of Copper for the East India Company and the consumption of his Majesty’s Navy and Merchant Ships, and for Manufactures, which have increased in as great a proportion, the Price of Cake Copper has been reduced by £22 5s. per ton, whereby there has been a saving to the Company upon 13,509 tons, which they had purchased from 1774 to 1782 inclusive, of the sum of £300,375.”⁴²¹ In 1789, according to Mr. Grenfell’s statement, copper cost in England £80, whilst in Sweden, as well as in Cadiz, the price was higher. In the same year the East India Company also paid £79–80 — no more than the English consumer. Only in 1790 did the peculiar state of affairs already referred to arise: — concurrently with a constant rise

in price a considerable rise in prices in England as compared with those in the international market and a correspondingly marked difference between home and export prices. And from this time the existence of the copper duty was important; earlier it would have been unprofitable at the low rate of prices in England to import even duty free, and therefore a duty was superfluous. Now the producer was for the first time able to add to the home price a part of the amount of the duty, and thereby to make a profit from the home trade. The reactionary movement of prices in the English copper market in the last decade of the century had obviously an intimate connection with a concurrent change in the organisation of copper mining. The period of low prices had not contented the producer, however much it had satisfied the East India Company and the home consumer. It was a period of severe competition, which depressed alike prices and profits. It dated from about the year 1773.⁴²² This same year was marked by the opening up of a new mining district in Derbyshire and Wales — the Anglesea mines. These mines could deliver copper ore at much cheaper rates than the old Cornish mines, and, although the ore cost more to prepare before smelting, still the Anglesea district competed very closely with the old mines. The low price at which the East India Company bought copper in 1781 was directly caused by the determination of the Cornish producers to “keep the Anglesea copper out of the market.”

The Cornish producers included both smelters and mineowners, as the combination of mine and smelting house did not exist in Cornwall as it did in Anglesea. It was probably the lack of this combination which made Cornwall feel competition so much. In 1785 the Cornish mineowners had had enough of the struggle. Addressing themselves to Mr. Thomas Williams, who already occupied a prominent position in the Anglesea district, they begged him to bring about an understanding between the two mining and smelting districts, of which the aim was to be “to bring the metal of both Countries to the Market at a fair stipulated Price.” By this means they intended to break with the old system of “public ticketing,” and to replace the sale of ore to the highest bidder⁴²³ by a system of fixed price agreement. In 1785 influential mineowners in Cornwall formed themselves into the Cornish Metal Company. This syndicate, in its turn, made a contract for seven years with all the Cornish mineowners, binding them to sell to the Metal Company seven-eighths of their total output of ore at a price to be fixed annually, the Metal Company reselling the same quantity to the smelters by virtue of an agreement with them. It was only after the

competition among the Cornish mineowners had thus been limited and in part replaced by a single sales organisation that it was possible to come to definite terms with the interests in Anglesea. There it had not been necessary to form a single organisation. Mr. Williams was “acting proprietor” of all the mines;⁴²⁴ he was the business representative of the whole district and embodied in himself the requisite compact organisation. Now that, on the one hand, the inter-competition of the Cornish mines had been greatly limited since 1785, and that, on the other hand, the copper ore syndicate and the Anglesea district had come to an agreement, there was ground for hoping that the prices of ore and copper would fall no further, and that the mines and smelting houses would become more lucrative again.

The exact nature of the “stipulations” which, according to Mr. Williams, were made with the Cornwall syndicate, is unknown. But from the fact that in 1787 differences arose between the syndicate and Williams as to the respective “Proportion of Sales at market,” it is obvious that there must have been some regulation of the contingent of output to be furnished by each. But their mutual relations did not remain long on the original basis. In 1789 already Mr. Williams had been invited to undertake the general business management of the syndicate.

Having on hand an unusually large stock of ores to get rid of, the promoters were afraid for the safety of the capital they had invested in the concern, if they could not find some capable individual to dispose of the stock at a firm price. They therefore placed the uncontrolled business management in Mr. Williams’ hands until the expiration of the agreement of 1785. Thus nearly the whole of the copper output in England and a considerable part of the stock of raw copper was at the disposal of one single individual.

It is difficult to determine how far Williams took advantage of his position to effect a rise in prices. The price of raw copper certainly rose again from 1787.⁴²⁵ But the reproach subsequently made against him was not so much that he had created an absolute rise in prices as that he had bought ore cheap from the mineowners and sold it dear to the consumers, whether smelters or others. By these means he was said to have forced up artificially the profits of the syndicate. This opinion is confirmed by the official statement of prices before the Parliamentary Committee, which gave the price of copper ore in 1787 at £67 4s. 10d. a ton, whilst the price of raw copper to the East India Company was £69–71. In 1790 the company had to pay £78, when the price of ore was only £63 8s. Apparently the attitude of the syndicate had contributed

to increase the disparity between the two prices, and it was therefore not surprising that Mr. Williams should boast subsequently that he had repaid the shareholders their capital plus 5 per cent, interest as long as the contract lasted, and that the obligations of the syndicate had been discharged in full. But while the syndicate was prospering, its policy was damaging two groups of interests. These were, first, the mineowners (who, though not participating financially in the syndicate, had delivery contracts at a fixed price with it), for in spite of the rise in copper prices, the price for ore was no higher than during the time of public sale; and second, the Birmingham manufacturers, who as consumers suffered from the high copper prices.

Individual mineowners first began to move in the matter, and finding that they could get a higher price for the one-eighth of their output which was at their own disposal than the price paid by the syndicate for the remaining seven-eighths, they put on the open market increasing quantities of copper ore in spite of the running contract. Mr. Williams replied by creating a new organisation of copper-sellers. In October 1790 he actually succeeded in securing the total output of Cornish copper for the Metal Company by means of a contract terminable at first in two years. The mineowners were to get a higher price for their ore — £76 a ton. For that they contracted to deliver exclusively to the syndicate, but “in case Cornwall produces a greater quantity of Ores, so as to exceed the Consumption, the same shall not be brought to market, but stocked up for the remainder of the term.”

The manufacturers of Birmingham saw with alarm that this contract had been the means of making the organisation of the copper trade a much closer one, in fact that it had become a monopoly. Like the tinfounders in the case of the tin monopoly, they proceeded to organise themselves.⁴²⁶ One of the experts stated before the Commission: “About this time a Company was formed in Birmingham, consisting chiefly of Consumers of Copper, called the Birmingham Mining and Copper Company. They were led to believe that the Advance upon Copper was not owing to the Price received by the miners, but to the expensive medium through which they received it. Their object, therefore, was to bring Copper to supply the Manufacturers of Birmingham as cheap as the nature of the Trade would admit.”⁴²⁷ This company and a second one, the Rose Copper Company, which was founded soon after, strove to outflank the syndicate and its associated smelting houses. They bought mining shares, acquired mines of inferior value, and above all purchased smelting houses. Once their own smelters, they tried to persuade mineowners to sell their ores to the

highest bidder by offering better prices than the syndicate price.⁴²⁸ An expert described the position as it now existed in the following words: “When the Birmingham Mining and Copper Company began to purchase, there was but a small Proportion of the other Ores sold at Public Ticketings; they however would give a better Price to the miner than he then received, and yet bring Copper to Market much cheaper than the Consumers could buy it elsewhere. This, I believe, induced some who did not think themselves legally bound, to withdraw from the Contract, and bring the Ores to open Sale.” Mr. Williams recognised the fact that there must be an alteration in his sales organisation if it were not to go entirely to pieces. The contract which he brought forward in November 1791 shows that his policy had changed. The syndicate was only to claim delivery of three-fourths of the total output of Cornish ore, and that at a higher price — £82. The smelters were to bind themselves not to buy in the open market, *i.e.*, by auction, on pain of forfeiting their share of the contract. The intention clearly was to cripple public sale, as the high prices reached at the auction of such proportion of output as did not belong to the syndicate had always tended to raise the prices paid by the syndicate. At the same time, Williams invited the Birmingham companies to share the contract with him.

But this organisation never came into existence. The companies in Birmingham considered the proportion of the copper output offered them by Williams too small. The Cornish mineowners, on their side, expressed themselves energetically against the proposal in a resolution on January 24, 1792: “To use Arts to obstruct the public Sale of our Ores and to decoy the offerers for them from the Ticketings, are not only manifestly injurious to us as Individuals, but prejudicial to the Interests of this Country.” So runs the second paragraph of this resolution. Henceforward the main mass of copper ore mined in Cornwall was disposed of by public sale as before.

Although the existence of the syndicate was suspended as far as it represented the union of the Metal Company with the Anglesea mines, the conditions which had given rise to the complaints of the manufacturers still existed.⁴²⁹ They were intensified at the beginning of the nineties, not only by the further rise in copper prices, but by systematic “dumping” in the export trade. This state of affairs led to the formation of the Parliamentary Committee on the state of the copper trade in 1799. The combinations and the agreements were formally dissolved. But the monopolist organisation of the copper trade, far from disappearing, continued to exist in another form. As a manufacturer said: “Since this Time, the greatest Part of the

Ores of Cornwall have been sold by public Ticketings; but even upon this Plan it is not difficult, when Copper is in Demand, for any Purchaser, who has a strong Interest in the high Price of Copper, to advance it as he pleases.”

Williams was obviously meant by the word “purchaser.” In any case, it was he who, up to 1799, was the most powerful member of the copper trade. In modern terms, he “controlled,” as he says himself, the entire output and smelting of Anglesea ore. He rented the mines from the two owners, and the entire management was in his hands. The output of the Anglesea district was about 1700 tons of copper in 1799, about one-eighth of the output in Cornwall. Even after the dissolution of the copper syndicate, Mr. Williams still maintained his relations with Cornwall.

It was shown in the evidence given before the Commission that Williams represented one of the eleven companies who appeared as buyers in the copper ore market. Although the company were not always buyers, they were kept informed by their agent, Mr. Vivian, of the conditions ruling in the Anglesea ore and copper market. The same Mr. Vivian was also agent for another company — the Cheadle Company, which bought every year in larger quantities. Thus Vivian was one of the largest buyers in the copper market. In the three months December to February 1799 he bought on account of the above two companies an amount of ore equal to 351 tons of copper. He had himself, in addition, financial interests in some of the mines. It was therefore to his interest to keep prices high both for ore and copper. The interests of the other mine buyers differed widely from one another. The two companies formed by a combination of Birmingham manufacturers had a lively interest in buying copper ore as cheaply as possible, as they worked it up into the finished article, and there would necessarily be a decrease in the consumption of their products if the price rose correspondingly with the increased price of raw material. As a matter of fact, it was stated⁴³⁰ that in consequence of the high price of raw material since 1793 the consumption of raw copper in Birmingham had decreased by 500 tons annually, and the conditions in the export trade had grown steadily worse. This was an established fact, vouched for unanimously by different witnesses. But the decreased demand from that quarter did not by any means check the movement of prices in the raw copper market. For the decline in the demand of this Birmingham high-grade industry did not hinder the general rise in the consumption of copper. The figures in the appendix to the report of the Committee showed that the consumption of copper bought by the government for the navy had increased very largely in the nineties, in

seven years amounting to as much as 1500 tons.⁴³¹ In any case, there was beyond doubt an increased general demand for raw copper, further stimulated by the purchases of the government and the East India Company, and in consequence a shortage of copper ore. This shortage led to the mining of much poorer ores than had ever before been put on the market.⁴³² But who fixed the price of copper? Williams, according to his own statement, followed the quotations for Cornish copper given by Mr. Vivian. But through his agent in Cornwall he was able indirectly to effect a rise in the price of ore, which in its turn naturally caused a rise in the price of copper. The Birmingham companies consumed their own copper. Many manufacturers bought copper in addition in the market. Mr. Vivian represented two companies. The number of smelters in Cornwall who sold copper consisted only of eight individuals. Thus competition among sellers of raw copper was extremely limited. It was therefore quite feasible for the smelters to cause a rise in the price of copper corresponding to the rising price of ore, more especially as they were protected by import duties. Williams, of course, profited most by the high prices. He himself supplied ore, and thus his profits from the sale of raw copper must have been very large. We hear, further, that he owned large works which were mainly busied in working up copper for the navy. Williams thus was the head of a business combination as well organised as any conceivable to-day. The smelting houses pure and simple were obliged to maintain the high price of copper, which was easy enough, as they were few in number and demand was increasing. The manufacturers of fine copper goods in Birmingham were alone in complaining of the high prices for raw copper. To get their stocks on cheaper terms they had broken up the former syndicate, but in so doing they had not rid themselves of the conditions to which they desired to put an end. In spite of the dissolution of the syndicate, several causes prevented a return of that competition which in the seventies and eighties had brought about the depression of prices. These were: the demand for copper (which increased rapidly soon after the dissolution of the syndicate), the output of ore which did not increase at a correspondingly rapid rate, and the small number of smelters and consequently of sellers of copper. In a rising market the concentration of the production and the sale of copper in a few hands rendered a joint agreement unnecessary, with one exception.

If the export trade was to be retained in the future, export prices must clearly be lower than those in the home market, now that copper prices in England were extraordinarily high compared with those in other exporting countries. This was the

chief consideration in transacting sales with the East India Company, who could easily provide themselves with Armenian copper in Smyrna when high prices ruled for English exports.⁴³³ It was therefore of the first importance to sell to the East India Company for export at lower quotations than those obtaining in the home market. No individual seller could have initiated such a line of policy, which would at best have resulted in a *lucrum cessans*. A general agreement was necessary to the carrying out of a method of exportation which sacrificed the individual in a certain degree for the benefit of the whole smelting industry. Such an agreement was all the more feasible as the East India Company only bought once a year, and then took over a large stock of copper for delivery within a fixed time. As Mr. Williams stated: "It becomes a treaty between the East India Company and the Copper Companies, who always unite on that Occasion. A few Days previous to the sending in of the tenders, the Copper Companies meet, and consider how far all or any of them are inclined to tender, and to what amount. It has been generally agreed amongst them, that they shall furnish the Contract when made in proportion to their Stocks on Hand, or rather the Amount of their Stocks purchased within the last 12 months; the Amount of those Stocks being fixed, the Proportions are made out to be delivered by each Company." We have seen already how such systematic "dumping" led to a marked differentiation between home and export prices, a differentiation made possible in the first place by the import duty.

Thus, even after the dissolution of the principal association, the Cornish Metal Company, an "Export Syndicate," continued to exist in the copper industry; whilst the aim of the earlier monopolist organisation — the keeping up of home prices — was realised without any special general agreement by the concentration of home production in a few hands. This was still more the case when home demand increased, and supply fell off greatly owing to large sales to the Continent whilst output did not increase in a correspondingly equal rate and import was hindered by the duty.

This is, unfortunately, the last that we know of combinations in the English copper industry, though probably a monopolist organisation continued to exist till later. Various writers in later years mention the "consolidations" which took place from time to time in the ownership of copper mines;⁴³⁴ but no detailed account of the results of such consolidations exists. Copper prices in the first decades of the nineteenth century were on the average hardly lower than at the end of the eighteenth.

Certainly they were much higher than in the middle of the eighteenth century. But after 1820 they began to fall.⁴³⁵ In the following years England lost gradually that supremacy of production which she formerly possessed. New spheres of production were opened up, and after the removal of the duties on copper in 1848 gradually eclipsed England as a copper-producing country. The output of copper in England in 1860 amounted to about 16,000 tons; to-day it is not above 500.⁴³⁶ Thus the conditions under which monopolist combinations can come into existence have long since disappeared.

(c) The Break-up of the Coal Cartel

Whilst unfortunately but little light can be shed on the later development and decay of the monopolist organisation in the English copper industry, the facts which led to the dissolution of the coal cartel have remained fairly clear. This is the more valuable in that the producers' organisation in the coal trade was much closer and more detailed and of far longer duration than that in the copper trade. The final break-up of the coal cartel meant the destruction of a monopolist organisation which, although it had suffered lapses and alterations of form, had existed close upon 250 years.

The prosperity of the coal cartel in the north of England had had a double basis. It rested on a monopolisation of the sphere of production and on a monopolisation of the export market both in London and on the coast. Production had become even more monopolised after 1830 when the mines on the Tees joined the cartel on the Tyne and Wear, while owing to the expense of bringing coal from other districts, the market was secure up to a fixed high limit of price. But after the close of the thirties both these foundations seemed to be tottering.

In the years 1836–1843, whilst the cartel still existed, difficulties of organisation arose which threatened to lead to a general collapse. From the middle of the thirties in particular both the number of mines and the producing power of the coal districts in the north of England had increased considerably. This increase was due to various causes. As the well-known mineowner, George Elliot, said⁴³⁷ later, “the high protective price was a temptation to colliery owners to open collieries.” The best north-country coal averaged in London in 1832–35 20s. 7½d. a chaldron. The price rose in 1836–38 to from 22s. to 24s.⁴³⁸ The “regulation price” for best coal in 1834–6 had been 26s. a Newcastle chaldron on the Tyne, and had then been considered high. In 1844 the cartel price had actually been raised to 30s. 6d. for best coal.⁴³⁹ These

high prices which obtained under the regime of the cartel naturally stimulated fresh enterprise, and thus created fresh competition with the cartel itself. Other circumstances now arose which further increased the tendency.

First and foremost the railway system was making rapid progress and constantly opening up new mining districts. The production of coal increased quickly in the district west of the Wear and the Tyne, which up till then had been unworked, owing to the great expense of transport. As technical progress in railway transport advanced, the cost at which coal could be delivered diminished in a very marked manner. A further factor now appeared. The mineowners formerly had owned railways and means of transport themselves. They paid the ground landlords for the use of the ground "wayleaves," which were sometimes so high as to necessitate a permanent large rise in cost of transport.⁴⁴⁰ Then came railway legislation, which empowered the promoters of public railway companies to buy the land required at a reasonable price. As by this means the railway companies found their traffic expenses greatly diminished, the network of railways extended more quickly than before, and a further increase of production in the districts affected took place. Less capital was now requisite for the opening up of a new pit, as the coal districts of the whole north of England were intersected by numerous railway lines, and mineowners whose mines were far from river or coast no longer needed to build their own railways, but simply used the nearest public line.⁴⁴¹ By considering how much the cost of transport from the mine to the vessel had added in former times to the cost of production in particular mines, it is possible to gauge the revolution brought about in the paying power of particular mines by the development of this network of communications. It suddenly became clear that the old mines, which lay close to the water and brought forward their own goods on their own lines at high wayleaves, had lost the advantage they had previously enjoyed over the more distant districts, and had become less favourably situated as regards freights than the "new" mines. "The construction of the railway system through the country," said Elliot, "gave facilities for opening out the coalfields extensively and with small capital; because I may mention that previously the large coalowners used to have their own private railways and their private places of shipment, and they had the whole trade very much in their own hand; but after the system of railways was introduced, the difficulties of maintaining the monopoly and high prices became insurmountable."⁴⁴²

At first the mineowners fought the new railway system; for they foresaw what it

meant for the cartel. As soon as Parliament empowered a railway company to purchase land outright, those mineowners who had to pay way-leaves protested vehemently against the building of any such line. “What we complain of,” said the secretary of the cartel in 1830, “is, that the Government should assist the proprietors of inland collieries, to enable them to compete with us in markets we were formerly in possession of.” In order to ward off this competition the owners of the old mines petitioned Parliament against the further multiplication of lines in Durham. Each individual member of the cartel was forced to make a money contribution, in proportion to his basis, to cover the expenses of the agitation against the railways.⁴⁴³ But this obstructionist policy could not hinder permanently either the extension of the railway system or the opening up of new mines.

According to Dunn, whose long expert experience in the mining districts of the north makes him on the whole a trustworthy guide, the number of the mines were as follows.⁴⁴⁴

District.	1830	1836	1844
Tyne	37	47	70
Wear	18	9	28
Tees	0	16	22
Hartley and Blyth	4	4	6
Total	59	76	126

These figures show how much the potential production of the north of England coal area had increased since 1836. But there was no increase in demand equivalent to the increase in supply. Great stress is laid on this fact not only by Dunn in his book, but later on by George Elliot, who had personal experience of these conditions.⁴⁴⁵ It was therefore only to be expected that there would be an increased amount of coal exported by the cartel, and, as a matter of fact, the export of coal did increase considerably between 1836 and 1842.⁴⁴⁶ But this increase in export, which at its highest at the beginning of the forties amounted to 800,000 tons more per annum than in the middle of the thirties, had little relative importance compared to the increased potential production of the northern districts, estimated at over 3,000,000 tons.⁴⁴⁷ Moreover the export duty of 1842 necessarily limited the use of this safety valve, as English coal consequently was unable to compete in the French market with

French and Belgian coal. The export, exclusive of “smalls,” showed a decrease of 480,000 tons as against the preceding year.²

The tendency to an increase of production and consequent depression of prices — the result of the growth of the mines and the comparatively slow increase of demand — was not in itself sufficient to cause the dissolution of the cartel. Earlier cartels had been founded in precisely similar conditions, with the precisely similar aim of so regulating by joint agreement the growing productive power of the mines, which was in excess of demand, that prices should not be depressed by increased competition. These were the motives which led to the formation of the cartel of 1771, and with this aim the mines on the Tees joined the cartel on the Tyne and Wear in 1833 after severe competition. Might it not be possible again to lessen the effect on prices of the opening up of new mines by a joint limitation of the actual output? Might not the allocation of production in accordance with demand even now result in a level of prices which would secure the further existence of both favourably and unfavourably situated mines?⁴⁴⁸

The cartel did, in fact, follow the only system which appeared to promise salvation. It limited output to an ever-increasing degree in comparison to potential production. In 1837 it put up for sale 80 per cent, of the original basis, in 1840 this percentage fell to 55.7, and in 1843 to 44. Thus the contingent furnished by particular mines became steadily smaller.⁴⁴⁹ One mine, the basis of which had been fixed in proportion to its estimated power of production at 50,000 chaldrons, was permitted to sell only 22,000 chaldrons in 1844, although in 1838 it had been permitted to sell 40,000.

The members of the cartel might perhaps have borne patiently with this system of increasing limitation of output had the result aimed at — the keeping up of prices — offered them any equivalent for the great diminution of actual as compared to potential production. But now a second danger shook the existence of the cartel to its very foundation: the price limit within which north of England coal enjoyed a monopoly both in London and on the coast began to fall.

It is not easy to give figures for the growing competition which north-country coal had to encounter in the markets of the south after 1840. It is however a striking fact that in 1836 only 2300 tons of coal were carried to London by inland water-ways, while in 1840 the traffic had increased to 22,000 tons, and in 1844 to 72,000 tons. Similarly, in 1844 carriage by railway began to assume larger dimensions.⁴⁵⁰ Nor was the growing competition with northern mines confined to London. As the increasing

severity of the rivalry between canals and railways forced down freights, Midland coal began to arrive on the coast. Finally, the increasing output of South Wales meant increasing competition for north-country coal and after 1840 Scotch coal was also put on the English market in increasing quantities.⁴⁵¹

In this way the “competition price,” that price limit at which it had been profitable to obtain supplies from other sources, fell considerably both in London and on the coast. This was first apparent in 1844. From Dunn’s statement it seems that consigners were the first to feel the impossibility of keeping up the cartel price, and that they suffered for some time from the difference between cartel price and market price. In 1844 the inevitable happened. The cartel price, which had been fixed at 30s. 6d. for best coal, had to be reduced to 25s.;⁴⁵² — in other words to a level, which, according to expert opinion in 1836, meant the loss of all profit on poorer qualities of coal.⁴⁵³

The position of the cartel now became more and more serious. On the one hand the strictest possible limitation of output; on the other a price which in comparison with the former standard was extraordinarily low, and which did not in any way compensate for diminished production. It is clear that the desire for an increased allotment grew continually stronger among those mineowners whose mines, even with low prices, could be worked at a profit, as long as there was a proportionate increase of output. Owners of less valuable pits were anxious to see a still further reduction of the allotment furnished by the more favoured mines. So a conflict, or rather a crisis, in the cartel was inevitable. Even so friendly an observer as Dunn recognised the impossibility of carrying on the organisation in its existing form. He wrote in 1844: “The evils of regulation heretofore have been the limited quantity allowed to each colliery under the abridged trade; but this has been felt more severely by the long worked and smaller collieries, where, in many instances, the quantity has been so limited, and the price so depressed, that nothing but a losing trade could result; and a strong feeling has prevailed, that their relief could only arise from a concession of the quantities disposed of by great and highly valued collieries for the general good. This feeling has been so urgently advocated that the present regulation agreement contains a clause for a general revision and settlement of the basis of every colliery in the trade; every individual thus satisfying himself with the hope that such general review will benefit him at the expense of others. This is the present understanding, but in the opinion of experienced persons, such period will never

arrive, inasmuch as the investigation would be too endless, and would in all probability create greater and more general dissatisfaction than that which prevails at present.”

And “experienced persons” were right. There was no revision. Why should mines working at a profit limit their output still further for the benefit of those not so working whilst competition in the south and on the coast was becoming more severe, and whilst no limitation of the vend in the north could force prices up to their former level? On the contrary, it was now to the interest of the paying mines to meet the fall in prices caused by competition elsewhere by an increase in output, which would enable them still to work at a profit. But the owners of valuable mines, who had formerly loudly advocated the cartel as the “preserver” of the inferior mines, had now no further interest in taking steps to their own detriment for the general benefit. Their indifference was shown by the fact that no revision took place, in spite of the needs of the non-paying mines. The long strike of April 1844 accentuated the effects of the drop in prices. Thus the year 1844 saw the break-up of the coal cartel.

From this time north of England coal has been sold by open competition among the mineowners.⁴⁵⁴ In 1845 one more effort was made to reorganise the shattered cartel as another and closer association.⁴⁵⁵ A number of large mineowners in Durham formed a scheme for buying up all the north-country mines and amalgamating them in one company. Circulars and prospectuses were printed, but the scheme failed in consequence of the opposition of some of the large coal magnates. A scheme proposed by the miners for a common regulation of production also failed.⁴⁵⁶ The cartel presupposed that it was possible to monopolise the market. The conditions which had annihilated this assumption became increasingly prominent after 1844. Although the output of coal grew rapidly in the north in the fifties and sixties, it increased still more rapidly in other districts of Great Britain. The output of South Durham increased from about 11 million tons in 1856 to about 17 millions in 1872. But the output of S. Wales for the same time increased from 5½ to 10 millions, of Scotland from 9 to 15 millions, and of the Midlands from 4½ to 10½ millions. In Yorkshire, Lancashire, and the western counties output had also increased rapidly, and the production of the N.E. district therefore lost in importance relatively to the total production.⁴⁵⁷

The possibility of intercompetition between the separate districts had been greatly increased by the growing development of means of communication. The great

economic advantage enjoyed by the northern districts had been due for centuries to the exceptional cheapness of sea carriage as compared with land carriage. The progress made by the canal and railway systems and by means of communication in general now began steadily to reduce the importance of sea transport. Inland districts were better able to supply the markets which had hitherto been dependent on sea transport. In 1850 55,000 tons of coal had been carried to London by rail, 85,000 by canal; in 1868 2,988,000 tons were carried by rail and canal jointly. In the years following transport by rail and canal grew rapidly in importance. Of 7,556,000 tons of coal consigned to London in 1872, 5,000,000 were carried by rail or canal. Moreover, the traffic statements of the railway companies interested showed that a large portion of the supply came from districts other than the North East. The Midland railway carried 1,615,000 tons, the London and North-Western about 1,000,000, the Great Eastern 687,000, and the Great Western 581,000.⁴⁵⁸ The means by which coal was supplied to London had therefore undergone an entire transformation since the palmy days of the cartel. We have seen that whilst the amount consigned to London in 1872 had increased to 7,500,000, the northern districts sent 2,200,000 tons by sea, and if we credit them with the amount carried by the Great Northern Railway only about 1,000,000 by rail. In the thirties supplies had only been obtained from other districts than the north-eastern in emergencies, but now these other sources contributed more than half the supply of the metropolis. The report of the Committee of 1873 drew attention to this revolution in market conditions in these words: "We do not believe that any combination either of employers or workmen can by artificial means succeed in permanently affecting the ordinary results of the relations of demand and supply by adjusting the quantity of coal produced to the demand, or can permanently affect the price resulting from the state of the market."⁴⁵⁹ The severe competition between the numerous areas of production which ruled in the central market and which was bound to increase with any rise in price, rendered hopeless the union of a single district in a cartel for the raising of prices. On the other hand the multiplicity of geographically separated producing districts made any combination between them difficult. Although England, as Sir George Elliot said,⁴⁶⁰ could not in the seventies reckon on imports of coal from abroad and therefore mineowners, in spite of free trade, had a monopoly of the home market, no cartel was formed to exploit this monopoly.

It was impossible to foresee that with the dissolution of the Vend an organisation

had broken up, which fifty years later would be characteristic of many industries in many different countries. Its history was rather regarded as an attempt to prevent the competitive struggle proper to all departments of industry from running its “natural” course, and its final collapse as a fresh proof of the correctness of the classical economists’ doctrine of competition.

Part III. The Modern Organisation of English Industry on a
Monopolist Basis.

Chapter VII. Introductory. Transition to the Present Time.

During the eighteenth, and still more in the first half of the nineteenth century — that epoch of unexampled industrial development — the industries of England present a picture of increasing production, rapid increase in the number of single undertakings and, in each separate area of production, the keenest competition between the various manufacturers only giving way occasionally and under pressure of certain exceptional conditions to a monopolist organisation.

For several decades this state of affairs remained substantially unchanged. When the Parliamentary Committee of 1886 published its comprehensive report on the depression of trade and industry, experts were still complaining of ruinous competition as loudly as they had done in 1833. Lord Brassey, who was the best judge of the industrial life of the time, ascribed⁴⁶¹ the crisis at the end of the seventies to “British manufacturers having gone far beyond their rivals abroad in the rashness with which factories have been multiplied.” But among the voluminous official reports of the eighties there is no hint that any effort had been made anywhere by means of any combination to weaken that competition which was so much deplored.⁴⁶² It is true that in the iron industry a few preliminary schemes for a systematised reduction of competition were brought forward, though they were not mentioned before the Parliamentary Commission. They were local combinations, mostly for the purpose of reducing the output of pig iron.⁴⁶³ Similar loosely organised unions can be detected in times of trade depression in the thirties.⁴⁶⁴ But, as in that case, the agreements of the eighties exercised no decisive influence on sale conditions in the iron industry, nor had they the least permanent character. To compare them in any way with the cartels and syndicates of the present is to put them in a false light. They would hardly have found a mention in English political economy of that day if it had not been thought possible to see in them, as Thorold Rogers does, smaller editions of certain trusts which shot up in the United States at the end of the eighties.⁴⁶⁵

Though Rogers believed he saw in 1889 that “the beneficial operation of competition was at an end,” and looked forward to the systematic formation of cartels and trusts in England in the near future, his prophecy was not fulfilled for another ten

years. On the contrary, the problem in England seemed rather to be why cartels and trusts should develop extremely slowly or not at all, while in Germany, France, America, and other great industrial countries such monopolist associations should spread so rapidly. Thus Prof. Liefmann writes⁴⁶⁶ “when the cartel problem was very prominent with us, England, usually the first in economic developments, had hardly heard of it,” founding his opinion on the results of personal study at the end of the nineties. It did not escape this careful observer that for some years past several monopolist undertakings had existed in Great Britain, specially in textile industries. There were not many, if those undertakings and combinations are subtracted which have often been inaccurately described as cartels and trusts,⁴⁶⁷ but there were enough to disprove the assertion that no monopolist industrial organisations existed in the home of free trade.

The number of lasting monopolist combinations existing in Great Britain at the end of the last century and the beginning of the present were far fewer than in America and Germany, their structure, their organisation and their spheres of action were entirely different, and their growth was less rapid than in other countries. But whatever the causes of these differences, which must be looked into presently, may have been, these monopolist undertakings cleared the way for new developments of industrial organisation. No present writer on competition could ignore the possibility of organising industry on a monopolist basis, as W. B. Hodgson ignored it in his work on the subject in 1870.⁴⁶⁸ But the criticism applied to this form of organisation in England differed very little from the views of monopolies held by classical economists. Even at the end of the nineties Prof. Edgeworth⁴⁶⁹ put forward the theory that the self-interest of mankind by its very nature necessitated competition: “Competition is an almost ineradicable growth of self- interested human nature. ‘Expellas furca, tamen usque recurret.’ Combinations resisting the tendency of this force are liable to disruption.” Thorold Rogers⁴⁷⁰ expressed himself (1892) with greater caution. He believed in a further development of the syndicate and trust system, whose beginnings he had observed. But, while not venturing to maintain that the position of the consumer was assured by the natural selfish interest of the producer, whose whole attention was directed to competition, he nevertheless held fast by the law of equalisation of profit held since Adam Smith’s time, which he looked upon as a palliative against any abuses caused by the monopolist element in combinations. “The most profitable process hitherto known and employed is for

strong men, or a combination of strong men, to ruin weak ones by low or unremunerative prices, and having secured a monopoly, to commence a legal pillage of the public. But though the expedient may enrich individuals, it is essentially transitory. Sooner or later competition reappears and extraordinary profits are arrested.”

It is not surprising that in the country where the doctrine of free competition had been accepted unconditionally for over a century, notwithstanding the change in the conditions on which that doctrine was based, there was nevertheless no sudden alteration of economic doctrine. This is the less surprising, as the change in Great Britain was taking place but slowly. It happened as with other economic theories. The classical economists’ doctrine, that competition was equally to the interest of the consumer and of the producer, had been regarded as an invariable truth, not because it was in any way correct, but because for a long time it was borne out by existing facts. In agriculture similarly the doctrine of the superior value of cultivation on a large scale was maintained just so long as cultivation on a large scale was the dominant form of agricultural industry. And economists who regarded the development of small cultivation, notwithstanding its rapid growth, with incredulity and suspicion, were equally slow to appreciate at its true value the rise of monopolist associations.

But when it was seen, towards the end of the last century and the beginning of the present one, how firmly industrial organisation on a monopolist basis was taking root in both Germany and America, how international monopolist companies were springing up, and how the monopolist movement was showing itself in England, then Englishmen began to realise that their former conception of competition failed to apply universally. Industry was being steadily reorganised in the largest industrial countries on a monopolist system, and this reorganisation produced entirely new economic phenomena. “The doctrine of free competition became no longer a fact, but a theory,” as Professor Brentano wrote in April 1904.⁴⁷¹ That competition among wholesale manufacturers which had been looked upon hitherto, and particularly in England, as the inevitable result of an immutable law of economics, now became merely a possible condition of industrial organisation and out of date at that. Many foreign critics considered the determined persistence of competition in English industry as a proof that monopolist organisation was wanting; and even to-day there are good grounds for this opinion. German and American economists, who have

studied the fundamental conditions of cartel and trust development, ought to investigate with special interest not only industries organised on monopolist lines, but also those where monopolist organisation has either not been tried or where it has failed. Only a close examination of these “defective” conditions can preserve the student of cartels and trusts from making hasty generalisations similar to those formerly deduced from conditions of apparently universal validity in the case of free competition. The industry of Great Britain offers the most convenient starting-point for such an examination, as many important trades which in other countries are worked on monopolist lines are here still subject to competition. If English writers on political economy had revised their still persistently insular theories in the light of the world’s new economic developments, this question would not have been neglected. But it was only when monopolist organisations began to show themselves in English industry that such problems excited interest. And even then there was no attempt made to discover why this special form of organisation had developed so late, and had been restricted to so small a circle of industrial interests — restricted, that is to say, in comparison with the importance of English industry in international economics.⁴⁷² Both English and continental writers were content, if ever they thought of the question at all, to attribute this rather perplexing phenomenon to special peculiarities of the English economic system without analysing in detail the influence of these very peculiarities on the existing conditions of competition. This was more supposition than explanation. It was considered, for instance, that free trade, or the low cost of freights owing to England’s insular position would make it impossible to form a cartel or trust for the raising of prices. This view must be discussed later on. It has been disproved now by the prosperity of existing monopolies.⁴⁷³ But even at the time when no monopolist organisation existed in English industry, objection ought to have been taken to this explanation if there had been any desire to prove as an actual fact what was after all only an opinion. The very principles underlying that explanation were questionable. For an industry can owe its monopolist position as regards a foreign country to other causes than a tariff or an advantage in freights. International agreements may come into play, and, finally, competition can force down prices far below that limit “at which imports from abroad into a free trade country seem possible,” a fact early emphasised by Prof. Liefmann.⁴⁷⁴ Later on we shall be able to give several instances to prove the actual realisation of this possibility in England. For the moment we turn our attention to a further “explanation” of the

slight development of cartels and trusts in England, which, although of an entirely different kind from the foregoing, has in common with it a want of positive proof — I mean the opinion that the objection of English manufacturers to cartels and trusts is psychological. The chief exponent of this theory is Prof. Liefmann,⁴⁷⁵ who maintains that “the chief reason for the absence of cartels in many branches of English industry lies in the fact that the doctrines of extreme individualism still retain a firm hold over English manufacturers. The idea that ‘free’ competition is the ‘natural’ condition of economic life, that it best secures the advantage of all, is still extremely common and extremely powerful among them.” His opinion, shared by Prof. Jenks,⁴⁷⁶ is certainly plausible, if we take into consideration the conservatism (somewhat strange at the present day) of English people in economic matters. In England the lack of cartels and trusts has often been held up as a sin of omission on the part of manufacturers. But no positive proof has ever been adduced that the lack of such organisation in the eighties and nineties was due to any such psychological aversion. The influence of the doctrine of free competition on the English manufacturer was taken as given, and his indifference to monopolist organisation seemed to follow from it. But concrete confirmation of this inference is all the more desirable as several facts are entirely against it, and tend to weaken the hypothesis connecting the slow development of cartels and trusts with the psychology of the manufacturer. The history of the early coal cartels is most important evidence that monopolist associations existed even at a time when the doctrines of classical political economy had far more weight with English people than they have now. And as Prof. Liefmann supports his conclusions as to the influence of individualism by the case of present-day competition in the English coal mining, we are forced to enquire why that individualism did not show itself when the mineowners created in the Newcastle Vend the most powerful coal cartel which has ever yet existed, and maintained it for seventy years. The monopolist organisation of copper production at the end of the eighteenth century is another important instance of the possibility of forming a cartel in former times, and Babbage in the thirties describes a bookseller’s⁴⁷⁷ cartel, the aim of which was “to put down all competition,” and which exhibited a striking similarity to the “Borsenverein der deutschen Buchhandler,” as we can prove, though exact details are wanting.⁴⁷⁸ Further, we notice in the eighties and nineties, when neither cartel nor trust existed, repeated attempts by large firms to initiate a monopolist organisation of their particular branch of industry. There

were, for instance, at the beginning of the eighties, attempts at forming a syndicate in pig iron, though they were not long successful. In 1894 a coal syndicate was formed in the north of England with the object of fixing a minimum price and of regulating conditions of output, but this also only lasted a few months.⁴⁷⁹ At the end of the eighties a syndicate was projected but never realised in the paper trade, the only monopolist branch of which at present is the wall-paper industry. Among other unsuccessful early monopolist organisations is the well-known Birmingham Alliance, which, created originally in the interest of the bedstead industry, transferred its activity subsequently to other trades. It was an effort to regulate the prices of the various trade products in conjunction with an organised association of workpeople. But these associations could not permanently withstand the pressure of outsiders and of foreign competition, and at the present time free competition obtains in these trades also.

Attempted cartels and trusts, which failed either because they never passed beyond the stage of a project, or because they had not sufficient vital power to carry them on for any length of time, can be seen in other branches of industry in the same years. It was clearly not through any lack of will on the part of manufacturers that the powerful and effective cartels and trusts of Germany and the United States did not exist in England. That their efforts to carry out their desires were unavailing was the result of competition, either that of the foreigner or that which arose at home.

It must therefore be recognised that the undoubted anti-monopolist conscience of the English nation and its belief in economic individualism has always been subject to limitation when the individual Englishman thought of himself as a producer and not as a consumer. The cartels and projected cartels of the past clearly show that English manufacturers have tried to form monopolist organisations wherever they saw a prospect of making any profit. English shipping firms inaugurated between 1870–80 the now well-known “shipping rings,” and English business houses gave the first impetus to the nitrate cartels of Chili early in the nineties. Facts such as these show that the English man of business is a much greater lover of cartels than he should be, if his adhesion to the principle of individualism were as firm as is generally supposed. Let us turn lastly to the testimony of Prof. Clapham,⁴⁸⁰ the author of the best extant work on English textile industries. “It is true that in all branches of the trade the promoters of a combination have to deal with special obstacles, not the least of which is the strong local feeling and pronounced individualism of the

manufacturer; but these things have been overcome before, and may be overcome again, when there is a gain to be made or a loss to be avoided." Thus, as the subjective conditions of monopoly have obviously existed in spite of the doctrine of individualism, we can only conclude that the external essentials of monopolist control were not as fully developed in England as in other countries, and that even at present they are in part lacking. What these "defective" elements are can be shown only by more intimate knowledge of the conditions of production and sale in those branches of industry in Great Britain which are still governed by competition.

Chapter VIII: The Sphere of Competition.

A considerable number of cartels and trusts in all parts of the world are essentially dependent on the existence of mineral deposits which are easily convertible into a monopoly. In the first place, certain minerals, being found only in a single country or in one or two countries, are from the outset a monopoly to the rest of the world. In this connection may be mentioned the powerful monopolies of the potash deposits in Germany, of kaolin in Austria, nitrate in Chili, marble in Italy, petroleum, copper and borax in America, zinc in Germany, Belgium and America, and diamonds in the Transvaal. Secondly, certain areas of production, such as the coal and iron ore districts of America and Germany, hold monopolies, if not in the world's market, at least in a given national area, generally as a result of the freight charges which a foreign competitor would have to face.

The naturally narrow limits of such mineral wealth and the marked tendency of mining from the very beginning to accumulate fixed capital have created relatively early and with comparative ease close monopolist combinations or a semi-monopolist predominance of particular interests in all such areas of production.

Great Britain, on the other hand, has no monopoly over other countries in any mineral whatever. The copper output of Great Britain, the largest in the world at the beginning of the nineteenth century, is estimated to-day at the trifling amount of 500 tons a year.⁴⁸¹ The output of English zinc is now equally unimportant.⁴⁸² Cornish tin, the best known in the world for over 2000 years, amounted to only 5040 short tons in 1905 as against 65,565 short tons produced in the Malay States.⁴⁸³ In the last twenty years the output of English lead has been only a small fraction of that of the United States, Spain, Germany, and Australia.⁴⁸⁴ At the present time the mineral resources of Great Britain are practically confined to a very few products. Out of a total value of £135,200,000 in 1907 £120,500,000 came under the head of coal. Iron ore accounts for £4,400,000; the extremely important branches of stones and clays,⁴⁸⁵ so necessary to the Portland cement industry, for £7,100,000; and the salt industry, which represents a not unimportant proportion of the world's production, for £600,000. In all, these four products represent a value of £132,600,000 out of £135,200,000. The remaining minerals are divided among products of which England

furnishes only a small part of her own needs. None of her chief mineral products are present in sufficient quantity to give them anything approaching a monopoly in the world's market. But from the point of view of its own national market it is a striking fact that precisely those very important raw materials and other products which are worked abroad as the closest monopolies, are subject in Great Britain to very marked competition. One most prominent instance is that of the coal trade.

Here we have to deal with a branch of English production which, although it has more and more lost during the last twenty years its former monopoly of the trade of the world, has, on the other hand, never been affected by foreign competition in the home market.⁴⁸⁶ In the eighties and nineties, even if an English coal trust had put up coal prices considerably, it would have had no cause to fear imports from abroad. Jeans writes⁴⁸⁷ in 1894: "There would appear to be no insuperable difficulty in the way of founding and carrying a combination to keep up the price of fuel at home, so far as foreign competition is concerned, and this is more than can be said of most other industries." Prof. Ashley in 1903⁴⁸⁸ was of opinion that if "very high" prices were to rule in the English market for a few months, German and French coal might perhaps be attracted to the country. But as a practical matter the importation of oversea coal has never been discussed in England. And it is not probable that foreign coal would be imported in the case of merely "very high" prices. It might be imported if prices were extraordinarily high in the English market, and at the same time very low in Germany, Belgium, or even America. But even in 1900 — the year of the great rise in the price of coal — when, with the additional impetus of the Boer war, prices were unusually high, German and American competition was not felt, though prices in Germany and America had not risen to anything like as high a level as in England.⁴⁸⁹ The increasing competition of these two countries was only to be detected by the fact that they competed more successfully than before with English coal in the export trade to non-English parts of the world. In some areas where English coal had previously enjoyed a monopoly, foreign coal even drove it from the field. Thus in 1900, for the first time, American coal appeared on the shores of the Mediterranean, while German coal competed with English on the northwest coast of France.⁴⁹⁰ But England itself during the coal famine had no recourse to imported coal.

In 1901 there was a marked fall in English prices; in Germany and America they remained unchanged.⁴⁹¹ It was perfectly plain that, in this condition of the international market, a coal cartel in England could have hindered the fall in home

prices, which only affected the home market, and in September 1901 certain important firms urged the creation of a cartel with great eagerness. Even opponents of the cartel system could not maintain that such a cartel by causing prices to rise would attract competition from abroad to England, so they had to be content with pointing out that in the long run a rise would increase the competition of the foreigner in certain export markets.⁴⁹² But the failure of the cartel and trust schemes of that time was certainly not due to any fear of provoking importation from abroad.

It was due to a very different cause. The same facts which had worked the ruin of the old Vend in spite of its seventy years of existence are at work to-day, and prevent the creation of a monopolist organisation in the English coal industry. As we have already seen, these facts were the multiplicity of the sources of production and their mutual competition, owing to increased means of communication since the latter half of the nineteenth century. In 1906 English coal production, which amounted to about 251 million tons, was distributed among the principal districts as follows:⁴⁹³ Scotland about 39 million tons, Newcastle and Durham about 54, Yorkshire and Lincolnshire 35, the Midlands 33, Wales about 52, Lancashire 11, Staffordshire and the southern counties 15 millions each. Coal is therefore produced in all parts of the country. There is no such localised concentration of production as in Germany (Rhenish-Westphalia and Silesia) and in America (East Pennsylvania anthracite and soft coal districts). Experience has shown repeatedly and clearly that the cartel system has little prospect of success where coal is so universal. The Durham Coal Association of 1894 lasted but short time after its increased prices had quickened the competition of Yorkshire coal on the London gas coal market. A similar fate befell a Lancashire and Cheshire Coal Association in 1894.⁴⁹⁴

In Wales the conditions were more favourable, and from 1870 up to the present time projected cartels have found here a suitable field for operation.⁴⁹⁵ But, excellent as Welsh steam coal may be, it has to compete when prices are high with coal from the north of England,⁴⁹⁶ so that in this case also any organisation to be effective must be able to control both districts.⁴⁹⁷

It must not be forgotten that the above-mentioned districts do not all produce the same quality of coal, and in so far they do not always compete with one another, some districts in this way having a preference in the market. But if any one district were to attempt to put up prices to any marked extent consumers could obtain coal supplies from other districts, though possibly of different quality.⁴⁹⁸ Thus we find in

the official report of 1873 mention of “the variety of coals produced, which though primarily used for particular purposes, will at certain prices be used for others.”⁴⁹⁹

The only exception in this respect is the anthracite district in the extreme west of South Wales.⁵⁰⁰ No other region of Great Britain produces similar coal. But the entire annual output is only 2½ million tons and the ownership of the mines is in many hands.

With this single exception, unimportant as compared with the total amount of coal produced, we are brought to the conclusion that monopolist combinations in separate districts could only have an extremely limited sphere of action. An effective monopolist organisation could only be formed if all the coal districts were combined in a systematic cartel or trust.

But the difficulties are great, as the excitement caused by Sir George Elliot’s trust scheme, published in the *Times* of Sept. 20, 1893, clearly showed. The scheme, which was never realised, was opposed by the trade on the following grounds: that it would be impossible to take into consideration the special conditions of production and sale in particular districts; that the number of mines to be combined was too large — they were estimated at 3400 pits; — and that as most of the mines belonged to private companies, the difficulty of buying them out would be all the greater.⁵⁰¹ The first objection was probably the most weighty. And in a lesser degree there were in each separate district a variety of separate interests to be considered, which entirely did away with the idea of a joint cartel, for the continued independence of individual firms would make any combined agreement on questions of price and production impossible. To buy out however so large a number of mines a much more tempting offer would be necessary than that which the “trust maker,” Sir G. Elliot, contemplated. For although, in view of the bad times, many mineowners were willing to sell, others thought the basis price of 15s. a ton, at which the properties were to be capitalised, much too low and not sufficiently tempting to induce them to sell. Monopolist organisation in English coal-mining would have a better chance if there were a concentration of undertakings in the separate producing districts. But up to the present this tendency is hardly noticeable. Even Mr. Macrosty, who describes each development of the concentration movement with special interest, because, in his opinion, it indicates the “movement towards trusts,”⁵⁰² has to content himself with stating that “a considerable number of firms and companies did in fact produce upwards of I million tons yearly”; that in “some districts” a “fair amount” of

concentration existed, but that very few general amalgamations had taken place.

The desire of creating a monopolist organisation to influence prices which leads so frequently to combination abroad simply cannot exist so long as competition is to be feared from other districts if prices are raised. On the other hand, this competition protects the buyer from the exactions of monopoly. Even the large consumers have no cause for fear, and there is therefore no need for them to buy mines to supply their own requirements; so that factor also, which might have aided the processes of amalgamation and concentration, falls into the background. Combinations, if made at all, aim, as a rule, at economising working expenses, or at technical improvements, such as the centralisation of water power. Such amalgamations have often, however, been financial failures, as for instance the United Collieries Co., which was floated when times were good, but over-estimated the advantages of combination and suffered from over-capitalisation directly prices fell after 1900.⁵⁰³

In South Wales concentration, like cartel projects, found to some extent a favourable soil. In 1896 Mr. D. A. Thomas, the well-known member of Parliament and mineowner, gave the first impetus to the movement. He wrote:⁵⁰⁴ “30 companies produce over 90 per cent, and about 50 companies produce 95 per cent, of the total output. If it were possible to get the 20 companies or collieries constituting 80 per cent, of the output to combine, the combination would, in my judgement, be sufficiently powerful to control and regulate the steam coal trade of South Wales and Monmouthshire.” But even this optimist thought it not improbable that some other competing district might take “an undue (sic) advantage of the regulation,” so that he especially added that provision must be made to meet this contingency. But the mineowners seem to have thought the prospect of rapidly growing profits not sufficiently sure, and the proposal met with as little success as Elliot’s more comprehensive one.

But Sir D. A. Thomas did not abandon his plans. He amalgamated several mines and founded the Cambrian Trust, Limited, in 1908, which produces about 4 million tons annually.⁵⁰⁵ He thus became the largest producer of coal in the country. But his enterprise did not seriously infect with monopoly a land which produced in 1907 267 million tons of coal, or for that matter even his own particular district. The output of coal in South Wales was nearly 50 million tons in 1907, close upon 3 millions more than in the preceding year,⁵⁰⁶ and many new mines contributed to this total.⁵⁰⁷

Yet it is an interesting fact that, if we neglect the smaller districts,⁵⁰⁸ it is precisely

in South Wales, which enjoys a certain advantage in competition over other large districts, that cartels and concentrations are most noticeable. This is indirectly a further proof of the assertion that in Great Britain it is mainly the multiplicity of areas of production and the divergence of their interests which prevent the formation of a monopolist organisation in the coal industry.

In the second greatest branch of English mineral production the absence of cartels or trusts is due to quite different circumstances.

Within the last twenty years the progress of iron mining in England has been slow and intermittent, but even at the present time, when its predominance has been contested by America and Germany, it is still the third greatest in the world.⁵⁰⁹ In the United States the ore-producing country of Lake Superior belongs to the Steel Trust, which was interested in the years 1902–7 to the amount of 50–60 per cent.⁵¹⁰ in the deliveries from this large district, and which by agreement two years ago with the railway magnate Hill obtained power to dispose in the future of the remaining riches of the district. In Germany, Minette iron, now the most valuable iron ore, has been monopolised by the manufacturers of finished products. In Siegerland there is the Iron Syndicate in iron mining proper, while but a small portion of the large iron production of Lorraine-Luxemburg reaches the market directly, most of it being further manufactured by the large iron concerns themselves — a fact which makes any special monopoly organisation such as a cartel or a syndicate for the most part superfluous.⁵¹¹ This is at least true so far as sales to outside smelters in the Minette and Saar regions is concerned, as the big sellers, who are comparatively few in number, can command a complete view of the whole market and check mischievous underbidding without any special system of regulating prices. It is only in the case of the relatively small sales to outsiders in Rhenish Westphalia that Spanish competition detracts from the power of the large mines to influence prices by their monopoly.⁵¹² In the United States the position is similar. The Trust and a few similar enormous combines control most of the iron production, and only small quantities come on the market.⁵¹³

In England things are very different. As late as 1903 Jeans was able to write “that the majority of the works engaged in pig-iron making in this country are pig-iron makers only, having to buy all their raw materials.”⁵¹⁴ But in Great Britain, too, in the last ten years, the tendency for related branches of business to combine has been making headway,⁵¹⁵ and many iron and steel works have their own mines. There is,

however, no question of any development on monopolist lines, such as some writers have thought this tendency denoted.⁵¹⁶ There is nothing in the Cleveland district or elsewhere corresponding to the monopolist concentration of Germany or America. Even if this were the case, it would still be impossible to speak of a monopolisation of the iron ore supply in England. The official figures for the consumption of iron ore in 1907 were 23,352,000 tons, of which no less than 7,635,000 tons were imported.⁵¹⁷ As the quality of the imported ore, which comes chiefly from Spain, is much higher than that of English ore, we may assume that 50 per cent, of the present English pig-iron output is manufactured from foreign ore. If the English were to employ more extensively in the future the Thomas process,⁵¹⁸ which they have neglected hitherto, home ores, to which it is well suited, would certainly be more largely used.⁵¹⁹ Even then the low rate of freight to England for Spanish ore,⁵²⁰ and the relatively small cost of inland transport in England itself, would be against any movement in the direction of monopoly. Even in Rhenish Westphalia there is competition between the Lorraine and Spanish ores, though the foreign ores have to pay much higher rates of freight, and this would necessarily be still more largely felt in England; consequently, one important reason for forming monopolist organisations in the iron industry of other countries — the exploitation of the protective effect of freights — does not exist in England. Again, in the case of the quarrying of stones and earths (specially sandstone, slate, limestone, chalk, clay) monopolisation is out of the question owing to home competition. The supply of these minerals is so abundant and distributed through such an extremely large number of competing districts that any monopolist movement is impossible. The trade also in many of the branches of production is extremely small and the plant comparatively undeveloped, so that in these cases even local monopolist associations would give an immediate stimulus to fresh competition.⁵²¹

Thus in England competition is still the ruling principle in the three most important mineral products. As we shall see later on, the same thing cannot be said of the fourth one, but its importance as compared to the sum of English minerals and of their three chief groups is insignificant.

We can therefore affirm generally: firstly, that England has no raw material in minerals possessing that monopoly in the world's market which favours the development of cartels or trusts; and secondly, that it is precisely in the most important of the existing raw mineral products that the conditions are most

unfavourable for monopoly. Monopolist combinations are consequently for practical purposes excluded from the sphere in which their success in other countries has been most marked.

Turning now to the finishing trades, in which, from their very nature, monopoly resting on natural scarcity is out of the question, what are the elements of successful monopolisation which are “deficient” in England? It is obvious that the protective effect of freights, which in England bear very lightly on heavy raw materials, can only influence the manufacture of high-priced goods in rare cases. The higher priced the goods, the more clearly must the English manufacturer recognise the fact that freight rates give him no advantage over the foreigner in the home market, which consists of an island with but a small inland area. The absence of protective duties in all those manufacturing industries which are or may be influenced by foreign competition considerably increases this openness to attack, and Free Trade is therefore a sufficient explanation of the non-existence of cartels and trusts in a large section of English industries.

Certain branches of the iron trade are an excellent example. Jeans writes with reference to the absence of monopolist associations in the production of pig-iron:⁵²² “The main reason for this fact is that while in protectionist countries prices may be regulated by such combinations within tolerably wide limits, here prices must be largely determined by the behaviour of the foreigner. An arrangement made to-day to sell at a certain regulated price may be completely upset tomorrow by the action of an outside country. Although the output of iron and steel throughout the world is now so enormous, the iron market is so sensitive that an offer of 25,000 or 50,000 tons of pig-iron or steel in markets like Glasgow or Middlesbro’ at 5s. or 10s. below current prices would completely demoralise the market and almost create a panic.”

It might perhaps be thought that English manufacturers would find a general agreement as to prices most useful and most easy to carry out if, in the case of an international fall in prices, English pig-iron fell lower than foreign. But the price, even in protected countries, may fall at the present day in times of depression to the level of the English price for pig-iron. In 1897 and 1898 Bessemer pig-iron cost in Pittsburg less than the best English.⁵²³ In 1903 west coast Hematite pig-iron cost 56s. 8½d., whilst Thomas pig-iron cost 55.9 marks in Dortmund. The lowest point reached by prices for American pig-iron was 12.46 dollars (about 50s.) in 1904, whilst similar quality pig-iron in England did not go lower than 52s. 2d.⁵²⁴ In such

conditions a monopolist movement to create a rise in the price of English goods would only be the direct way to encourage importation from abroad. If even in protected countries the price of pig-iron is in depressed times no higher than the English price, then “dumping” is dangerously near at hand, and it becomes easy to understand the alarm felt in 1908 by the English ironmasters at the dissolution of the German cartels in pig-iron and the expected fall in prices.⁵²⁵ The imports would of course be felt less in the form of pig-iron than in that of blocks, bar-iron, and other semimanufactured articles; but yet in consequence of the above-mentioned conditions, the import of “unworked or half-worked” steel rose from 280,000 tons in 1902 to 522,706 tons in 1904.⁵²⁶ Although we find in an English Blue-book of 1903,⁵²⁷ “the possibility of obtaining cheap German steel has materially reduced the demand for pig-iron,” it is nevertheless clear that any monopolist rise in the price of English pig-iron at such times would merely increase “dumping,” to the prejudice of the owners of large blast furnaces. The case of the iron founders is slightly different. Great Britain (especially the Cleveland district) exports considerable quantities, whilst prices in America as well as in Germany are even in bad times higher than in England by the greater part of the duty and freight.⁵²⁸ In this case there would be no cause to fear foreign competition in depressed times even if prices were regulated on a monopolist basis. But every such rise in prices must still further narrow the market abroad, which shrinks in any case considerably in such times, while any difference that might arise between the home and the near foreign market⁵²⁹ could only be very slight as long as free trade put no difficulty in the way of re- importation.

When there is a general rise in prices in the international market the price of English pig-iron goes up considerably as a rule, so that a monopolist price policy must seem unnecessary to manufacturers. Actual experience has shown that in January 1907 West-Haematite rose to 77s 9d., and averaged during the year 74s. 9d. as against 53s. 5d. in 1904, and that Cleveland pig- iron rose during the same period from 43s. 11d. to 56s. 2d., while the export of English pig-iron jumped up from 814,000 tons to 1,947,000 tons. It may therefore be said: Price conditions in the English pig-iron trade are determined so much and so directly by market conditions abroad, that English manufacturers would find a monopolist price policy useless in bad times and unnecessary in good ones. Loose agreements as to price, and even these only in exceptional economic conditions, are the most that can be expected. As may be guessed from the foregoing, it is the same with a number of semi-finished

iron and steel products, such as rolled blocks, bar-iron, and bars. Foreign competition would leave English cartels or trusts very little power to fix a price limit.

In attempting to mark out that sphere of English industry in which free trade is still a defence against monopolist prices, we must consider all those industries (i) where the importation either of the same goods or of substitutes is easy; and (ii) where English prices are normally the same as import prices (freight included). In all such cases a monopolist rise in prices created by a limitation of competition would simply encourage the foreign competitor. Both the silk⁵³⁰ and the paper trade fulfil these conditions. As a protective policy gave the first impetus to the prosperity of the Paper Trust in America,⁵³¹ so, conversely, free trade in England makes a monopolist agreement as to price impossible. A Paper Makers' Association, which regulates certain trade usages, does certainly exist, but as one of its members wrote not long ago,⁵³² "while one thing more might have been tried, they knew they could have but little control over it: regulation of wages and prices must be left untouched." Although the paper trade in England, especially in its printing branch, has developed on a very large scale, and only the largest factories survive,⁵³³ this concentration of trade has, nevertheless, not been able to bring about an agreement as to a rise in price, because the position of prices is too strongly affected by the possibility of foreign competition.

Attempts to disregard or only half recognise this condition of affairs and to regulate prices on monopolist lines generally end very quickly in a fiasco. The collapse of the Birmingham Bedstead Makers' Alliance in 1900 is a good example. It had doubled the price of bedsteads since 1891, but the final result was that "foreign competition was stimulated" and the cartel fell to pieces.⁵³⁴ A very common instance of such competition from abroad is seen in cases where a monopolist association holds only a local monopoly, or where substitutes may possibly enter into competition. Imported goods will then in part be able to take the place of home products, thus limiting the extension of a monopolist price policy over the entire total production. Instances of this will be given when we come to consider the monopolist associations of to-day, as they concern free trade as a means of *reducing the sphere* in which a monopoly may be dominant, rather than as a *preventive* of monopoly.

Its significance as a means of defence against the monopolist price policy of a national organisation of manufacturers may be deduced from the well-known fact that within the last thirty years England has imported in yearly increasing quantity

many classes of goods in which she formerly had the predominance over other countries, at least in the home market. Free trade has of late years contributed essentially to the non-existence of monopolist associations in all such branches of industry. In former days they might quite possibly have been organised on monopolist lines, so far as foreign competition was concerned.

This fixes, however, only one of the limits of competition in English industry. Where for any cause, in spite of free trade and the slight protective effect of freights, there is immunity from foreign competition, the formation of a monopolist organisation becomes independent of these factors; on the other hand, high freights or even protective duties do not in themselves necessarily entail the creation of a cartel or trust. It remains to determine the sphere of competition within the bounds of home trade, *i.e.*, to distinguish the essential factors which prevent the substitution of monopolist combination for competition, if home trade is regarded as a self-contained entity.

The industrial competition on which the classic economists based their observations is still dominant in a considerable proportion of English industries at the present time. In many trades manufacturers are increasing in number and production is extending, and, consequently, it becomes more and more difficult to create a monopoly. The increased profits which existing manufacturers might hope to gain thereby, would only stimulate the growth of fresh undertakings, whilst in any case existing firms are far too numerous to combine in a monopolist organisation at all.

This is pre-eminently the case in the textile industry in its simplest stages, both in cotton spinning and wool spinning and weaving. In cotton-yarn spinning at the present time there is a very large amount of over-production,⁵³⁵ which manufacturers attribute, not without reason, to the rapid rise of new mills during the last period of inflation. The joint action of manufacturers and trades unions in 1904, which shortened hours of labour and therefore limited production, has not approved itself as a means of moderating competition and over-production, although Mr. Macrosty⁵³⁶ enumerates it in his "Trust Movement" as being the first step to further organisations. On the contrary, that organised limitation of production, with its consequent increase of profits, has made competition keener than ever. The value of exported grey yarn rose from 11.25d. in the years 1900–1903 to 13.55d. in the four following years,⁵³⁷ while the number of joint-stock undertakings, which had only increased by twenty-four between 1900 and 1903, had risen to ninety between 1904 and 1907.⁵³⁸

“Certainly the great trade boom of 1905 and succeeding years was ushered in by a prolonged spell of organised short time in 1904, but trade booms are a little out of favour in Lancashire just now. It seems pretty clear that the great reduction in the output of yarns and cloth helped to dislocate the relations of supply and demand, and by bringing almost unparalleled profits stimulated an immense excess of the means of production.” For this reason, according to the *Manchester Guardian*, manufacturers both in Oldham and Bolton were now (1909) against any “organised” limitation of hours of labour.⁵³⁹

In the wool trade there seems to be the same, or even a greater possibility⁵⁴⁰ of calling new undertakings into existence. Professor Clapham states⁵⁴¹ that it is still common to find mills occupied by more than one manufacturer and firms starting with small capital. The small trader rents a few rooms or perhaps a whole floor in a wool mill; while looms belonging to two different firms and driven by machinery which belong to neither are often found in one and the same factory. This system of providing factory space, machinery and requisite power to firms with small capital (the Tenement Factory or Machine Renting system) is naturally extremely favourable to the growth of smaller concerns.⁵⁴² It has been a matter of much complaint of late that this organisation is being exploited by speculators in order to persuade the hands to make themselves independent without starting on a sound basis. In like manner, the commission system, which exists in every department of the wool trade but specially in spinning and weaving, encourages the rise and continuance of the small capitalist as a manufacturer by the side of the large concerns.⁵⁴³

It is the more remarkable that these conditions should be predominant in the textile industry as it is precisely within the limits of the same industry in the last ten years that the English trust movement has largely developed. Whilst in spinning and weaving, on the whole, competitive conditions of trade are still to be seen, we find in several finishing branches of the trade, as well as in some of its special grade products, a marked concentration. This fact shows the impossibility of accepting without qualification the statement often made,⁵⁴⁴ that, as the manufacture of high-class goods increases, the chances of a coalition will diminish because the number of concerns will then be more numerous than in the earlier stages. It entirely depends on how far the technical development of each grade has advanced. Under certain circumstances it is just the high grades in which the particular impetus to concentrate has been given. There is, for instance, all the world over, less

concentration in the production of pig-iron than in the manufacture of steel rails.

Many facts could be adduced to illustrate the special difficulties of forming monopolies in finishing trades. Monopolist associations find their progress hindered where ever there is a great differentiation in the quality of the products of the finishing industry. This is particularly noticeable in England. For many branches of English industry have, in view of the competition of countries which can supply in bulk articles of inferior value at lower prices, directed their attention more exclusively to the production of specially highly finished goods. In this way distinctive qualities and brands arise which give individual manufacturers so strong a position against other competitors, that they reject all proposals for coalition. This appears to be the case in the paper industry. The association of makers of paper for newspapers has to face great foreign competition, but in highly finished English papers on the contrary there are so many qualities made that, although there is hardly any question of foreign competition, there appears also hardly any possibility of a joint regulation of price.⁵⁴⁵ Woollen yarns are in exactly the same case. Imports affect yarns "which are either not spun in Bradford or whose manufacture does not pay there."⁵⁴⁶ The quality of English woollen yarns is admitted to be the finest known, but many very different kinds are made; in consequence, no monopolist organisation can be formed, as Prof. Clapham expressly points out.⁵⁴⁷ With reference to this particular case he writes: "For as a rule only the producers of articles that come into fairly direct competition with one another are easily moved to set bounds to the force of that competition by means of joint action."

Important as it is to recognise this condition of things, the fact must nevertheless not be lost sight of, that sometimes where firms owing to the manufacture of special brands hold an exceptionally advantageous position, the chances in favour of a monopolist organisation seem particularly great, as such firms would have very little fresh competition to fear if they were to raise prices by joint agreement. As we shall see further on, many monopolist associations, in the woollen industry in particular, owe their success to this fact. But we must remember that the monopolist position arising from the possession of special makes is then always held and jointly exploited by a not very considerable number of firms. In general, therefore, the question seems to be whether a concentration of manufacturers of highly finished goods has taken place or not, and whether new undertakings will increase competition with ease, or slowly and with difficulty. For if very many firms manufacture articles for which

each has a reputation, coalition will be made just as difficult as it is made easy by the existence of a few firms supplying well-known specialities.

In the case of many highly finished manufactures (and fine grades) we find England confirming the view that it is comparatively easy to create new competing undertakings if demand increases. As in other countries, the size necessary for a profitable business in such branches is relatively small compared to the total production of the country, and therefore there is less need of fixed capital than in the case of half-manufactured goods. We find accordingly that, (i) the number of existing undertakings is comparatively large; and (ii) it increases rapidly when demand grows and profits rise — two conditions which make it extremely difficult to shut out competition.

Examples are numerous enough. The Bedstead-makers' Alliance, though its collapse was partly due to the increase of foreign competition, had seen new factories grow from 40 in 1891 to 56 in 1899, and its own importance diminish correspondingly.⁵⁴⁸ With worsted yarn it is the same. Here the non-existence of a monopolist organisation is sufficiently accounted for by the fact that the old-fashioned "family business" still preponderates, and that it is only quite of late years that joint-stock companies have been founded.⁵⁴⁹ In 1906 a meeting of the worsted yarn spinners of Bradford was held to consider the question of organisation, and less than 106 firms⁵⁵⁰ were represented. But the number of competitors being so large (and they all moreover held fast by their traditional independence), no agreement could be come to. In the manufacture of tubes, the large number of firms — 50–60 working concerns with a production of 300,000 tons — accounted for the non-existence of an association. In addition, increased prices would mean at once fresh competition. As Mr. Arthur Chamberlain said in 1902, "A great number of people who had now gone out of competition, still had the requisite machinery, and if there was any chance of making any plunder, there was no doubt they would speedily reappear as tube manufacturers."

As compared with other countries, specially with the United States and Germany, the size of undertakings in many branches of English industry is relatively small, because the need for vertical combination is less. In a country where protective duties and monopolies of raw goods hinder the manufacturer of finished goods from obtaining supplies of materials, and where, at the same time, it is impossible for the finishing manufacturer to make the consumer pay directly for the monopolist higher

price of material, an intimate connection with raw production and half manufacture is unavoidable. The most important of the few raw products of England are not under a monopoly, and an artificial rise in the price of raw materials owing to protective duties is out of the question. Accordingly, the process of combination has been a much longer one in England than in countries where the industrial element saw in it a means of protection against an abuse of power on the part of producers of raw materials and half-manufactured goods.

Thus we find, for example, that in the English steel industry a steel works is by no means always combined with a blast furnace. In Germany and the United States the large steel manufactories are always combined undertakings, whereas Jeans in 1906 represents the combination of different branches of business only as being “increasingly recognised.”⁵⁵¹ Even most important firms, such as Armstrong’s, Whitworth & Co., David Colville & Sons, or the Steel Company of Scotland, do not at the present time own any blast furnaces.⁵⁵² On the other hand, the large blast furnaces are still dependent on the sale of their material. We shall later on have to explain how a change appears to be taking place in this respect. It is only essential here to state that until a short time back (and partly, indeed, up to the present time) manufacturers of ingot-iron in England did not consider combination so pressing a matter as did the manufacturers in other countries. As coal, iron ore, and pig-iron were neither under a monopoly nor protected by a duty, the iron manufacturer regarded the gains of his purveyors only as customary profit; in fact sometimes he could obtain single materials at prices below what it would have cost to produce them.⁵⁵³

Only recently Lord Furness stated⁵⁵⁴ that the marine engineering works under his direction had closed their once profitable forging department because they “could obtain forgings at considerably lower prices than they could either produce them themselves or buy them in this country.” As vertical combination makes ever-increasing demands on the capital of the united undertaking, the relatively small amount of influence exercised by such combinations in English industry means that it is easier to start competing works in England than in the United States or in Germany. Further, whilst the vertical combination in the latter countries has often led to a complete monopolisation of raw materials, this development, which would entirely exclude competition in finishing manufactures, is non-existent in England. It is quite conceivable that more English paper manufacturers might think it advisable

to follow the example given by a few of their number, and to acquire forests and wood-pulp mills abroad. If the scheme were really able to make such undertakings more profitable, it would force subsequent new mills to keep up the pace, and by considerably increasing both the amount of capital necessary and the risk run, would probably make it more difficult than before for any such mills to be founded. Yet they might, though with difficulty, spring up. In the United States and in Germany, however, matters are different. Monopolies of raw materials in all kinds of industries make it impossible to start new works in any finishing manufacture. Witness the American Paper Trust, which owes its power to the fact that, aided by high duties on wood and pulp, it has monopolised the native forests and consequently lamed fresh competition.⁵⁵⁵ Witness again the steel trade in America and Germany, in which the creation of new undertakings on a large scale is hindered by the monopolisation of the deposits of ore,⁵⁵⁶ or the soda cartel in Germany, which has combined with the salt cartels in refusing to supply new works with salt.⁵⁵⁷ Similar cases often occur in countries where extensive monopolies of raw materials exist side by side with finishing manufactures; but they are not to be found in England where there are only isolated monopolies of raw materials, and even these, as we shall see later on, have only a comparatively limited sphere of operation, the great mass of raw material required by English manufacturers being imported duty free and at low freight rates. It might be thought within the bounds of possibility to create a trust in English finishing manufactures by the aid of a foreign raw material monopoly, and one such attempt has been made by the American Borax Trust which owns a few refineries in England. But generally speaking it has not been found possible by monopolising raw materials to promote monopolies in remote stages of finishing manufactures otherwise exposed to competition.

There are therefore a number of circumstances which serve to explain the continued existence of competition in many English finishing trades. Two of these circumstances — the existence of a large number of undertakings and the comparative ease with which this number may be increased — are very marked in one English industry in particular in which the conditions of competition stand in sharp contrast to those in Germany and America. This is the tin-plate industry.

Inasmuch as foreign competition is in fact unknown and need not be theoretically excluded for purposes of argument only, tin-plating offers an excellent illustration of how the home trade itself may necessitate the continuance of competition. The

English or, more particularly the Welsh makers have a dominant position in the world's market. Exports rose from 271,000 tons in 1901 to 405,000 tons in 1907. There are no imports from abroad. Germany is forced to import tin-plates from Wales (export to Germany was estimated at 41,000 tons in 1907); and in America there is a considerable market for purposes of high-grade manufacture in spite of high protective duties. Welsh plates are exclusively used in British India, and in Canada their position is equally safe as long as the American tin-plate industry cannot export in large quantities.⁵⁵⁸ Nevertheless, although Welsh tin plates, alike in the home market and for the greater part in the foreign market also, hold such a position that prices might be forced up without stimulating outside competition,⁵⁵⁹ there is no trace of a monopolist organisation. This is all the more striking as ever since 1862 the tin-plate industry in Germany has possessed a syndicate in the Weissblechverkaufskontor, and the American industry, which is of much more recent growth having existed only since 1892, became subject in 1898 to a trust, the American Tin-Plate Company, since 1901 a member of the Steel Corporation.

What is the explanation of this peculiar position? As regards comparisons between Germany and England, it is at once noticeable that in Germany five works suffice for the relatively small production of tin plates, and the creation of a cartel is, therefore, naturally a simple matter. They have practically no German competitors. Tin-plating, in spite of the protective duty, is not a very paying industry,⁵⁶⁰ for the cost of the necessary skilled labour is high, and as owing to cartels and duties it is so difficult to obtain a supply of raw material that only a "mixed" works is in a position to make tin-plate making profitable,⁵⁶¹ existing works have kept their monopolist position undisturbed. Germany only manufactured about 47,000 tons of tin plates in 1905, against England and Wales's 644,000 tons, and had a correspondingly smaller number of works. This is due to two reasons: first, in tin-plating trained manual labour still plays the chief part, machinery being of less importance, and, therefore, the size of a profitable business is relatively small; secondly, in Wales, tin-plate works pure and simple, which buy tin-plate bars, are no worse off than larger "mixed" works, as there are no duties to send up rates, and on the contrary half-finished goods can often be bought from abroad at "dumping" prices.⁵⁶² This enables the smaller capitalists to exist beside those who combine steel and rolling works with tin-plating. These two circumstances together caused the production of tin plates in England to be divided in 1906 among 74 firms, according to Rylands.⁵⁶³

In 1905 and 1906, when trade in tin plates was extremely good, the number of mills and works increased considerably.⁵⁶⁴ Many considerable difficulties must be met with in projecting cartels among so great a number of undertakings. When the American Trust was founded in 1897 the manufacture of tin plates within the Union amounted only to 250,000 tons, and only about thirty-eight works had to be bought up in order to control 90 per cent, of the production, many of which had been rash speculations and were very nearly bankrupt.⁵⁶⁵ In Wales, on the contrary, there are practically no unprofitable works. All have an excellent type of workman at their command and a firm hold on traditional markets. As an expert explained to the Tariff Commission — “We cannot make a monopoly in the tin-plate trade, because it is divided up into such small units.”⁵⁶⁶ Even if a combination of the existing works were to be formed, it would probably only attract fresh competition in view of the resulting rise in price.⁵⁶⁷ For trained workers, who are of the first importance in the tin-plate industry, are abundant in Wales; and fresh tin-plate works make relatively small demands on capital, so long as machinery is of less importance than manual labour and as new undertakings can be formed in times of prosperity as tin-plate works pure and simple.

The main factors which make the suppression of competition among English manufacturers at the present time impossible or in the long run inadvisable have now been considered, and the general outline of the sphere of competitive industry in England should be clear. But in the last ten years the limits of unrestricted competition have been increasingly narrowed by a number of circumstances which have given a growing impetus to monopoly in certain trades. These circumstances we must now investigate.

Chapter IX: Existing Monopolist Organisations in English Industry.

(a) The Movement Towards Concentration.

Perhaps the most far-reaching innovation in competitive industry during the nineteenth century has been the appearance of what is called the concentration of industrial units. The course of development has been by no means uniform, as a review of any reasonable number of English industries shows. With rising demand the number of separate makers may be permanently increased, as in cotton spinning, even though as time goes on the average size of each separate unit is very much larger than it was. On the other hand, we also find the peculiar position, sometimes by no means new, that an increasing demand is satisfied by a continually decreasing number of firms, the greater productive power of the single unit reducing from decade to decade the aggregate number of firms.

Nowadays this concentration, which John Stuart Mill noticed in the case of gas and railway companies, is not confined in England to staple industries. We meet it also in other cases; in shipping, in both wholesale and retail trade, in hotel-keeping, in newspapers, and in urban traffic schemes.

We are not now concerned with the historical origins of this general tendency, nor need we investigate in detail its causes. It interests us only from the point of view of industrial competition. We regard it merely as a special variety of industrial development, one of many directions which manufacturing on a large scale may take. Every factor which can exercise any considerable influence on the origin and development of such an industry — changes in facilities for communication, increased competition, new inventions and discoveries, and so on — can equally be the basis of a concentration of industrial units. The primary result of enormous industrial undertakings is the increased efficiency of each unit. If, however, the circumstances of the case are such that the demand for the commodity in question can be satisfied by fewer concerns of greater productive power, we then arrive at the special case of a concentration of industrial units. The productive power of an economically profitable undertaking grows so much faster than the aggregate of

goods actually produced in the industry, that production is gradually concentrated in the hands of an increasingly small number of concerns. And just as a multiplicity of undertakings makes it difficult to suppress competition, concentration, if combined with a reduction of the competing undertakings,⁵⁶⁸ makes it proportionally easy.

Nowadays concentration often appears at the very beginning of a new industry, when the productive power of an economically profitable unit is such that a few units alone suffice to meet the entire demand. But more usually it is the result of a lengthy process, in which the technically more efficient overcome, after severe competition, the less productive, and acquire their markets. The history of the English paper trade is an interesting example. Statistics of the licences granted show that in 1801 there were 413 paper factories; in 1811, 527; ten years later, as many as 564. Between 1803 and 1831 the amount of paper taxed in the year rose from about £31,000,000 worth to twice that amount.⁵⁶⁹ In other words, the increase in the number of paper mills was accompanied by a corresponding increase in production.

The next period shows a different picture. Between 1841 and 1845 there were still on the average 497 mills, but the number then sank steadily. The following are the figures for the whole United Kingdom:⁵⁷⁰

Year.	No.
1876–80	362
1881–85	340
1886–90	319
1891–96	307
1896–1900	292
1901	290
1902	287
1903	282
1904	279

The production of paper rose from 43,350 tons in 1841 to 773,550 tons in 1903, but the number of mills fell from nearly 500 to 282. Continual improvements in machinery, the inaccessibility of certain older works to markets, and the increasingly strong competition of the more efficient mills were, according to Spicer,⁵⁷¹ the causes of this concentration.⁵⁷²

In the production of pig-iron the tendency to concentrate appeared much later. From 1796 to 1880 the number of furnaces in existence rose steadily from 124 to 926, and there was a corresponding increase in production from about 125,000 tons to about 7,700,000 tons. But after 1880, though production increased, the number of furnaces fell — to 908 in 1884, 790 in 1890, and 514 in 1907.⁵⁷³ Even more interesting, perhaps, is the decrease in the number of working furnaces.⁵⁷⁴

Year.	Furnaces working	Production of pig-iron in tons.
1865	629	6,365,000
1880	567	7,749,000
1885	434	7,415,000
1890	414	7,904,000
1895	344	7,703,000
1900	403	8,959,000
1905	345	9,608,000
1907	369	10,114,000

The special cause of the tendency to concentration, in this instance, lay in the changes in the construction of furnaces. They have been so often described in the case both of Great Britain and of other countries, that it is unnecessary to re-state them now, and, in any case, we are interested in the fact of concentration only. Many firms or concerns owned more than one furnace, and therefore the figures given above are no exact measure of the decrease in competition with which we are concerned.

But statistics of particular districts show that a considerable concentration of interests accompanied the concentration of ironworks. I will quote some of them. In the most productive pig-iron district of Yorkshire, eighteen firms owning 92 furnaces, produced 1,747,000 tons in 1885; in 1907, there were only thirteen concerns producing 2,537,000 tons. Of the 92 furnaces in 1885, Bolkow, Vaughan & Co., owned 21; in 1907, they owned 25 out of a total of 77. During the same years the number of furnaces in Durham fell from 60 to 39, while output increased from 730,000 tons to 1,144,000 tons. Of the 39 furnaces Bell Brothers, in Middlesbrough owned 12, the remaining 27 were divided between seven other firms. Since 1885 the total number of firms decreased by five.⁵⁷⁵

In Cumberland, too, a new era of concentration has commenced with the recent reconstruction of the Workington Co., an amalgamation of four companies, either entirely or as regards particular works. The new company embraces 22 furnaces out of a total in the district in 1907 of 36.⁵⁷⁶

Even in the tinplate industry, in which there had been, as we have seen, relatively little tendency to manufacture on a large scale, and where even now such developments are far less advanced than in other industries, statistics of the number of works show signs of concentration.⁵⁷⁷

Year.	No. of tinplate works.
1800	9
1825	16
1850	34
1860	40
1865	47
1870	59
1875	75
1885	96
1906	74

In 1880 the number of mills (of which many concerns owned several) was 369; in 1891 it reached 524, with an output of about 663,000 tons. When the output of tinplates in England, which had been much reduced in the nineties owing to the American protective duties, again reached in 1906 about the same amount (actually 681,000 tons), the number of mills had sunk to 453.⁵⁷⁸ That was it is true owing to the trade boom an increase on the previous year; but the general history of tinplating in the last twenty years shows an unmistakable tendency towards concentration, even though high profits produce a temporary increase in the number of mills and undertakings.

The cases so far quoted illustrate movements towards concentration arising from a permanent enlargement in the normal size of an undertaking. Where this increases more rapidly than the total output requires it leads to an absolute decrease in the number of works, and in most cases also of undertakings. It must be left to a history of industrial concentration to describe the specific technical improvements which led

in each case to an increase in producing power, the economic circumstances which made it profitable to adopt them, and attendant features of the movement: — the extinction of inefficients through bankruptcy, their purchase and closing down, amalgamations, and so on. We are only concerned with the contrast between the development of concentration in recent times and the present day, and the absolute increase in the number of works in the days when industry on a large scale commenced at the beginning of the nineteenth century — a contrast which existing statistics unfortunately only make possible in a few though not the least important branches of industry.

Nowadays combination among works which produce the same commodity gives rise to a further concentration — the so-called “horizontal” combination. Technical changes in the process of manufacture or in productive power are in such cases either absent or at least not decisive. Combination more often results from purely economic causes. Separate undertakings hitherto working in competition combine to obtain higher profits by uniting all existing works in one concern. Where this kind of combination arises there is very probably a simultaneous concentration of plant; and it is also conceivable that technical improvements are made in the works of the united undertaking. But while concentrations like that in pig-iron could be regarded as exclusively due to increased productive power, horizontal combinations are the result of systematic efforts on the part of manufacturers to organise more completely the production and sales of all works concerned, concentration of plant being only one means among many.

Mr. Macrosty has collected a great deal of information concerning horizontal combinations and the resultant concentration of undertakings in British industry in his exhaustive book. He shows how the organisation of many works into a single combine has developed in the most diverse spheres of industry, in fact practically everywhere. That leaders of industry well understand the advantages of such combination and make it the centre of their efforts in organisation may be seen, apart from Mr. Macrosty’s instances, from a remarkable speech made in 1908 by Sir Christopher (now Lord) Furness. As director of one of the largest firms in England for the manufacture of ships’ engines, Richardsons, Westgarth & Co., Limited, he suggested on the 29th of December 1908, a fusion of that undertaking with various other similar concerns. To him this might well have appeared as a mere repetition of a proposal which had led to the foundation in 1900 of the firm of which he was then

a director — a combination of Th. Richardsons Limited, Sir C. Furness, Westgarth & Co., and William Allan & Co., representing a paid-up capital of £790,000 sterling.⁵⁷⁹ The new amalgamation was intended to embrace a number of undertakings which had together supplied no less than 1206 ships with engines having 2,150,000 horse-power in 1902–1908. The plan, up till now unrealised,⁵⁸⁰ would be of no greater importance than hundreds of similar combinations, but for the very incisive description given by Lord Furness of its various advantages, which, in consequence, may therefore be taken as typical of all horizontal combinations. They were as follows:⁵⁸¹

1. A large number of materials at present either bought from the firms with whom it was proposed to combine or produced at purchase prices could be provided much cheaper under a combination. Substantial profits could only be made by engine makers in the production of separate parts and details if it was carried on on a large scale. “The production of marine machinery and the mass of detail connected therewith involves so many trades, each requiring a separate department, the specialised production in bulk under highly concentrated management becomes practically impossible for the average engine builder; but under an adequate scheme of amalgamation the entire proposition is simplified. . . . The detail alone in connection with a yearly output of 172 sets of machinery is enormous, and were it standardised and manufactured under modern conditions profits would be obtained which, under present conditions, are quite impossible.”

2. Great economies would result in the actual making of engines and boilers. “Each builder had some points of excellence, either in design, arrangement of parts, quality of material or of workmanship which in combination would yield greater excellence ... Again, each firm has an expensive staff producing designs practically identical with those of its competitors, as well as pattern shops producing equally identical patterns.” As designs and patterns for a cargo boat’s engines cost about .£500 to produce, the importance of the saving suggested is obvious.

3. Economies in the organisation of the works and of deliveries would follow. Expensive overtime would be abolished, or only resorted to very exceptionally, owing to a better division of work among the various shops. Similar relief could be given in event of local pressure, and there would also be no reason why ships should not be engined at the port in which they were built, whereby each of the amalgamated works would save insurance, towage, etc.

The advantages which Lord Furness attributed to this scheme of horizontal combination figure in dozens of prospectuses of large amalgamations, especially in textile and steel amalgamations, sometimes in a more exaggerated, sometimes in a less detailed form. If the combination is carried out and the promised economies achieved, a new industrial unit is formed which, as a rule, outdoes all former rivals both in the range of its production and the lowness of its cost of manufacturing. In any case it represents another victory for concentration.

There remains to be mentioned the form of concentration known as the “vertical” combination. As we have seen, this is much less common in England than in Germany or America. Owing to the absence of the tariff duties, of high freights, and monopolies in raw materials which increase the cost of supplies of raw materials and half-manufactured goods abroad, the necessity of vertical combination is less imperative for the English manufacturer, and in any case in finished articles vertical combination as a means of monopoly is practically unnecessary. It is used merely to suppress ordinary middlemen’s profits and to increase the profits on the last stage of production by combining with it the various intermediate stages. As a rule therefore it follows a concentration of plant or a horizontal combination. This is especially the case in the high-grade finished goods, in which it only becomes profitable to take over the production of raw material or half-manufactured articles, as Lord Furness’s remarks on marine machinery works clearly show, when a very large concern is formed, or many undertakings are amalgamated. In lower grades, however, an ordinary modern firm can usually profit from vertical combination, and we find it, for instance in recent developments of the steel trade, as a result of the increasing expansion of separate concerns.⁵⁸²

Such “mixed” undertakings are also to be found in shipbuilding. Messrs. John Brown & Co. Ltd. use their own ore and coal, and provide all engines and steel ships’ fittings from their own workshops.⁵⁸³ In paper making again, as mills steadily grew, the largest — Lloyd’s — took to producing cellulose also. It has fifteen machines against nine at most in all former mills.⁵⁸⁴ In newspapers it is the same. Lord Northcliffe, the largest newspaper proprietor in England, declared in 1907 that a rise of ¼d. per lb. in paper prices would cost his company (the Amalgamated Press Ltd.) more than £70,000 a year;⁵⁸⁵ and accordingly they have bought forests in Newfoundland and erected mills for manufacturing cellulose and paper there.⁵⁸⁶ The great soap firm of Lever Bros, has had a very similar history. Their output has risen

from 20 tons a week in 1886 to 2400 tons a week in 1899. Between 1895 and 1899 to secure their large needs in the way of raw material more cheaply the firm set up an office for collecting copra in Sydney, an oil mill in Polynesia, a mill for extracting oil from cotton seed on the Mississippi and another for Egyptian cotton seed at Port Sunlight.⁵⁸⁷

Experience of German or American “vertical” combinations would lead one to expect that such combinations would greatly influence the movement towards concentration in England. But this is not so. As we have seen, the economic urgency of “vertical” combination in the land of free trade, low freights, and no monopolies in raw materials is less, and therefore the “mixed” works do not necessarily force the remaining undertakings to follow their example. In Germany and America the large firm which has grown to be a “mixed” undertaking can usually manufacture the final product at such a much lower cost that only similar combination can save the rest from its competition. This consideration and the fear of not being able to combine later when all raw material is completely monopolised generally leads to the rapid “vertical” combination of more and more firms. As all are not in a position to meet the large capital demands of “vertical” combination, where a distinction between “simple” and “mixed” undertakings arises, it tends ultimately to concentrate production in the hands of the latter. But in England few traces of this connection between “vertical” combination and concentration are as yet to be seen. The “simple” rolling works have not yielded to the greater strength of the “mixed” works. Cheek by jowl with Messrs. Brown & Co. there are firms like Armstrong’s or Vickers, Sons & Maxim, whose production begins with steel, and by the side of Messrs. Lever a number of important firms which buy all their materials;⁵⁸⁸ and while in Germany most large paper mills own their own wood-pulping plant,⁵⁸⁹ in England there are only two such firms, and their organisation is not by any means regarded by the other large mills as in every way to be imitated. Possibly at some future time “vertical” combination will lead to a “horizontal” concentration of firms in some industries, if not generally, owing to the suppression of “simple” undertakings by the great “mixed” works. But for the moment there is little sign of it, and no change is probable so long as the above circumstances continue to favour “simple” works. It is not “vertical” combination that causes the concentration of plant and undertakings,⁵⁹⁰ but, vice versa, concentration of plant or horizontal combination that leads to vertical combination. In other words, vertical combination is one of the

economic advantages which may possibly be obtained by these two forms of industrial organisation.⁵⁹¹

This conclusion is of great moment for its bearing on the importance to the growth of monopoly in England of the movement towards concentration which we have described above. As we have already seen, the significance of concentration in the history of cartels or trusts lies primarily in the fact that a decrease in the number of rival firms makes it easier to suppress competition. Secondly, the difficulty of founding a new undertaking increases in the exact proportion in which that undertaking — to be an effective competitor — requires a large amount of capital and a wide sphere of activity, and the more certain it must be, as will be explained later, of finding a profitable market for the great increase of commodities which it adds to the total output of the trade. “Vertical” combination has hitherto had but little influence in England (unlike other countries) on the concentration of undertakings concerned in a given branch of production. It can therefore be neglected for the moment in considering the conditions necessary for the creation of monopoly. Concentration of plant and “horizontal” combination, on the other hand, have proved to be very important antecedents to industrial monopolies in modern England. Both by diminishing the number of competing firms and by adding to the difficulties of new competitors they increase the general possibility of monopoly in an industry. But it by no means follows that they will in every case lead to the rise of a monopolist combination. To enumerate, as Mr. Macrosty does, numerous cases of concentration of works which have nothing in common with monopolist control of the market, in a book on the “Trust Movement” is to ignore the fact that concentration and monopoly are two different things. Waring and Gillow’s, to take one of his examples, and one that represents the result of several amalgamations,⁵⁹² may be the largest firm of furniture manufacturers in England; but it has in no way a monopoly in furnishing and decorating, and in view of the great number of similar firms in existence no likelihood of forming one. The inclusion of such firms in an enumeration of English trusts merely because they are notably large undertakings is as confusing as the identification formerly so common of all the various kinds of combinations of interests, e.g., ordinary English associations, with syndicates and cartels. It would be as reasonable to see the advance of the trust movement in every large hotel company or in every large stores.

What is true is that every concentration of producers has a natural tendency to assist

monopoly. But monopoly or trust or cartel implies the preliminary exclusion of competition as such, either completely or to a considerable degree. Even highly concentrated undertakings need immunity no less from foreign than from domestic competition if they are to create a monopoly. In the pig-iron industry, for instance, works and businesses have been concentrated on all sides, but up to the present foreign competition has prevented any monopolist combination from gaining a footing. Similarly the effectiveness or otherwise of domestic competition depends on the degree of concentration attained in each particular instance. Two cases must be distinguished. Concentration may be adopted as a means to permanently greater production in each factory or undertaking, which may finally result in the acquisition of a monopoly or something very like it by the undertaking which proves to have the greatest efficiency. Lord Furness's plan would not only have created an undertaking of greater efficiency than the aggregate of all the individual undertakings it amalgamated. It would also have created an undertaking exercising a monopolist control over the production of ships' machinery on the North East coast. The horizontal combinations made by each individual undertaking in its own particular branch of trade would have ended in a final "efficiency" combination, formed to reduce the cost of production, but at the same time a "monopolistic combination." In this case the movement towards concentration would have run its full natural course before ultimately culminating in monopoly. But long before this stage is reached manufacturers may seize upon concentration as a possible means of creating monopoly. Concentration of works or horizontal combination reduces them to a relatively small number, say twenty or thirty, and in given circumstances a monopolist organisation is then possible without any increase of economic efficiency either immediate or prospective worth mentioning. In the first case, concentration aiming at increased efficiency leads directly to the monopoly of the survivor; in the second, it merely results in the possible systematic suppression of home competition by reducing the number of competitors and facilitating their combination. In either case the movement towards concentration — if concentration of works and horizontal combinations aiming solely at increased efficiency are included under that term — must have reached an advanced stage.

If on the other hand the number of existing works or undertakings is very high, as in the paper trade, even a good deal of concentration would find it difficult to suppress competition. And further, if concentration would reduce the actual number

of factories but, given increased prices and profits, the rise of new factories is relatively easy as in tin-plating, the individual manufacturers must see from the beginning that the absolute suppression of mutual competition in order to reach high monopoly prices may, under certain circumstances, involve greater risks to their future than its continuance.

Concentration, therefore, only leads to the rise of cartels and trusts under given conditions, one very important factor in which is foreign competition. Where freedom from such competition coincides with certain possibilities of development by industrial concentration and horizontal combination, the ground is prepared for monopoly.

We must now examine the actual history of monopolist combinations in the light of these two main conditions, freedom from foreign competition and completeness of domestic combination.

(b) The Chief Existing English Cartels and Trusts.

If we review English industries from the standpoint of their relative freedom from foreign competition, we shall find that they fall into three groups. The first group consists of industries sheltered only conditionally from the foreigner; — industries helped by no special advantage in production over other countries, but enjoying the natural protection of freights; industries only subject to foreign competition on rare occasions when protected syndicates are compelled to dump; or, finally, industries in which foreign competition only takes the form of imports of inferior qualities or of substitutes. Wherever such circumstances or a combination of them arise, competition between manufacturers usually keeps prices under the limit which would pay the foreign exporter, though it would allow a monopolist organisation to take advantage in its prices of the freedom from foreign competition existing within that limit. The second group comprises industries holding an unconditional monopoly against the foreigner, and in which a monopolist organisation in fixing its prices and regulating its production, will have regard to consumption, to the rise of other home competition, to the possibility of re-imports, and so on, but not to foreign competition; in other words, industries in which either imports are impossible for technical reasons, or in which decisive advantages in the quality of goods, or extremely low cost of production, secure a monopolist position to the home trade. The third group consists of those in which security from foreign competition is

assured, as it always may be, by international agreements. We will commence with the consideration of various monopolist combinations in the first group, starting with one closely connected with the production of raw materials.

THE PORTLAND CEMENT TRUST.

All the evidence we have so far considered shows how comparatively rare it is nowadays for an English industrial monopoly to be protected from foreign competition by freights. But there are certain trades in which the relatively high cost of transit, where distances are considerable, favours the English manufacturer. The case of minerals would naturally suggest itself, but we have already seen that these are not very numerous in England. There can be no question of protection in the case of iron, for the superior quality of Spanish and Swedish iron more than covers the extra cost of freights, while cheapness of production alone is enough to secure coal and salt from foreign competition in the home market. But in the cement industry, which is entirely dependent on the supply of clay and chalk, freights are of some importance.

The industry is concentrated in the Thames and Medway valley, near to the chalk pits of Kent and Essex, which produce three-quarters of the entire output.⁵⁹³ It is therefore favourably situated with regard to supplies of raw material, and owing to the two rivers, the proximity of the sea and of a great consuming centre (London) can find an outlet for a considerable part of its produce at a very small expenditure on freights. The coincidence of all these factors gives cement makers better facilities for production and sale in this district than perhaps anywhere else in the world.⁵⁹⁴ The English makers, with their usual conservatism, for many years neglected possible improvements in quality, and accordingly suffered increasingly severely in some foreign markets from German competition. After 1900, however, English processes began to improve, and at the present time experts consider that English cement is fully comparable to that of other countries, both in quality and in cheapness of production.⁵⁹⁵

When there is a good demand for cement in the world's markets, and consequently no dumping from Germany, Belgium, or France, the Thames-Medway district is effectively sheltered from foreign competition by its low rates of freight. For a long time strong competition between the rival manufacturers prevented this advantage being fully utilised. But in the late nineties there appeared to be considerable

likelihood that this competition would be suppressed. Thirty-one firms, one of which had a productive power of 160,000 tons or 10 per cent, of the entire output of 1899, controlled 89 per cent, of the total production,⁵⁹⁶ the concentration being no doubt due to the bad market conditions of the nineties. Improvements in machinery since 1872 and the almost complete displacement of manual labour made considerable capital necessary for the foundations of new concerns and thereby impeded their rise,⁵⁹⁷ and finally the universal boom in the cement trade since 1897 removed any fear of dumping.⁵⁹⁸ The prospects of the Portland cement trust, founded in July 1900 under the name of the Associated Portland Cement Manufacturers, were accordingly exceptionally bright, although the frequency of chalk and clay deposits put any scheme of forming a monopoly of supplies out of the question. The trust included 27 of the above 31 firms, and had cartel agreements with the remaining four.⁵⁹⁹

At the present time the “outsiders” have increased in number, but the trust remains the dominant factor in prices, so long as it is secure from foreign competition. The import of cheap “natural cement” exercises, however, a moderating influence. Unknown till 1895, it rapidly increased after 1897 and latterly amounted to between £150,000 and £300,000 annually. It was in no way caused by the trust’s operations on prices; it commenced at the moment when cement commanded a price it had not reached since 1892. England both exports and imports an increasing amount of cement, the explanation being that the imports are of an inferior quality. Natural cement can, in point of quality, in no way compete with Portland cement, but owing to the high price of the latter, it is used for cheap buildings as a substitute. Statistics of the value per cwt. of the exports compared with that of the imports also show how much less valuable the imported cement was and still is. Those who required Portland cement at any price found no substitute in natural cement, cheap though it was, and the trust was therefore in so far not damaged by it. But it no doubt gave those who were less particular the opportunity of becoming independent of the high prices which ruled in the early days of the combine.

The further fall of prices between 1902 and 1905 itself followed by a decrease in imports may therefore have been accentuated by an excessive increase of prices on the part of the trust. But the reduced demand for cement at the time in England as in other countries, for instance Germany,⁶⁰⁰ must have led in any case to lower prices. Mr. Macrosty,⁶⁰¹ failing to take into consideration the conditions prevailing before 1900, states that, “for all their millions the Associated Manufacturers could not

maintain prices,” but that fact proves nothing as to their monopolist endeavours to influence them.

The trust could never have dreamt that it could permanently fix an absolute standard of price: all that it could possibly do was to make prices reflect more closely than they had done in the days of competition the protection from the foreigner⁶⁰² given by freights. In this it was successful in good times, as the high prices of 1900 and 1901 show; and it cannot be doubted that the prices would have subsequently fallen even quicker and lower if the trust had not existed. Mr. Macrosty declares that the trust reduced its prices, but tried to delay their fall by restricting production as the demand decreased.⁶⁰³ In any case, whatever may have been the limitations on its power, the trust retained an influence on prices and production which the separate firms never had in the days of mutual competition.⁶⁰⁴

THE STEEL ASSOCIATION.

The state of foreign competition in the English steel and iron trade is very peculiar. Taking the trade as a whole there is a marked excess of exports over imports.⁶⁰⁵ Exports amounted in 1893 to about £20,200,000, and, apart from occasional lapses, have risen steadily to £46,500,000 in 1907. Imports in 1893 were worth rather under £4,000,000, even in 1907 only just £7,000,000. But the far greater importance of exports must not be taken to mean that England is secure in all branches of wholesale iron manufacture from foreign competition. We have shown already the importance of foreign competition in the English market in the case of unmanufactured steel, imports of which (ingots, billets, bars, etc.), though still very slight in 1890, increased largely after 1900, and have since 1904 made up one quarter of the entire value of imported steel and iron — a fact with which English manufacturers must reckon not only in times of admitted “dumping,” but also in ordinary years.⁶⁰⁶ Assuming that “blooms” and “billets” represented about three-quarters of the imports of unmanufactured steel,⁶⁰⁷ about 450,000 tons were imported in 1905. In the same year the home production may be estimated at about 680,000 tons,⁶⁰⁸ which clearly shows the importance in this case of imports. Other imports, for instance plates and sheets of all kinds, give very different results. They were 71,928 tons in 1903, only 68,765 tons in 1905, the year of the largest total import of foreign steel; 82,000 and 56,000 tons in 1906 and 1907. If we assume with Jeans⁶⁰⁹ that the total production of plates in Great Britain in 1905 was about 2,000,000 tons, tin plates and black iron plates

being excluded, the small relative importance of imports as compared with those of half-manufactured iron is clearly seen. And while England exports no half-manufactured iron, the exports in 1907 of ship, bridge, boiler, and other crude iron plates alone amounted to 232,622 tons, and that of galvanised plates to 467,889 tons.

It must be admitted that in times of dumping import figures of comparatively small seeming may hide very serious competition with home producers. In 1902 and 1903 English manufacturers of ship and boiler plates certainly felt dumping very much:⁶¹⁰ ship plates sank in Cleveland from £8 7s. 6d. in May 1900 to £5 7s. 6d. in December 1903.⁶¹¹ But even in such times, as Jeans expressly insists, the danger of dumping is much greater for producers of half-manufactures than for those of heavy manufactures. And while, after the tide of dumping ebbed in 1903, a not inconsiderable import of half-manufactured goods has remained, the imports of plates and steels are still, as we have seen, so small in comparison with the home production that in ordinary times they can hardly be regarded as competing at all.

Competition being thus limited, the prospects of a monopolist association for the manufacture of ships' boiler plates have not latterly been unfavourable. The rising demand since about 1905 has kept particular countries, especially Germany, from dumping, and agreement among the English masters particularly in this trade would very largely contribute to profiting from the favourable state of the market.

No insuperable difficulties were to be found in the condition of the home trade. There was, it is true, mutual competition between several districts, Scotland, the north of England, and the north of Ireland, each more or less equally favoured by position. But within each district only a small number of firms made ship and boiler plates, and the desire to monopolise the local market soon brought makers together.⁶¹² Local monopolist associations like the Scotch Steelmakers' Association, founded as early as 1886 by the union of the four leading firms, arose. The Association practically abolished local competition, in the hope of thereby becoming better armed against freebooters from rival districts. The other districts followed suit about 1900;⁶¹³ and the union of the comparatively few masters in each district prepared the way for a wider organisation, when, at the end of 1903, the period of "dumping" ceased.

The monopolist organisation, which thus arose and exists to this day, devotes its main energies to the geographical division of the market. The two main rivals, the

Scotch Steel Makers' Association and the north of England makers, have since 1904 entered into agreements which secure each party the undisputed right to certain areas, and thereby make it possible to maintain prices within those areas. Scotland withdrew from north of England markets, and received in return Belfast.⁶¹⁴ The effect of this arrangement was not long hidden. An Irish firm had remained outside the "combine" and undercut their prices in Belfast, with the result that they were forced to sell much cheaper than on the Clyde and in the north of England district where the understanding could be maintained. The combine accordingly commenced to "dump" in Ireland, and the Clyde shipbuilders complained that this policy gave an advantage of £2000 on every 7000 tons ship to their Irish rivals.⁶¹⁵ In 1908 the Midland steel makers also came in. The Midland consumers struggled, we are told, in vain against the prices of the local association. They sent their orders to the Clyde makers, and the following extract from the 'Iron and Coal Trades' Review' for September 1908 shows the result.⁶¹⁶ "The English makers drew the attention of the Scotch makers to the position, and the latter, out of loyalty to their compact, have raised their quotations for plates in the English districts concerned by 2s. 6d. a ton. This will force the English consumers back to their old supply. The new quotation is actually 2s. 6d. a ton over what is named for local deliveries in Scotland, and is about 10s. a ton above what is asked on exports for foreign markets. It is fully five years since this understanding originated, and year by year it has gradually extended its borders until now it is the most important of the kind in the country."

Differentiation between home and foreign markets is not here, as in the case of several English combines, a mere unfounded rumour nor the exceptional concomitant of one or two export contracts. On the contrary, trade papers regularly quote both prices. The 'Iron and Coal Trades' Review' for January 1909, for instance, gives the following:⁶¹⁷

Scotch Home Prices.

	1st Jan.	10th March.	8th June.	16th Sept.
Boilerplates, £7 7 6		£7 2 6	£6 17 6	£7 2 6
Ship plates, 6 12 6		6 7 6	6 2 6	6 10 6

Scotch Export Prices.

	1st Jan.	1st April.	1st July.	1st Sept.
--	----------	------------	-----------	-----------

Boilerplates, £6 18 9	£6 18 9	£6 15 0	£6 17 6
Ship plates, 6 0 0	5 15 0	5 12 6	5 15 6

It seems at first strange that export prices of this kind are possible in the home of free trade without encouraging reimportation. But the geographical distribution of the exports must be remembered. Of the 200,000 tons of plates exported from England in 1908 the great majority went to India, Japan, Norway, Australia, Canada, and similar countries⁶¹⁸ whose distance involves high freights for such heavy articles. In this case, therefore, home prices could be maintained above export prices by the amount of return freights, whereas, in the case of raw iron exports, which go mostly to Germany, Holland, France, and Italy, even a monopolist combine would find their maintenance a difficult matter. The most important condition of success was, of course, the control of home prices by the suppression of competition. The question became a very burning one at the end of the steel boom in the winter of 1907, and as soon as the first signs of falling demand were felt, works were closed under a general agreement, and compensation paid to their owners by the remaining firms.⁶¹⁹

It is difficult to form an opinion of the policy of the associations in the matter of prices. In 1906 the secretary of the Iron Trade Association stated⁶²⁰ that “a very remarkable improvement took place in the nominal prices of finished steel manufactures, and these were generally adhered to, manufacturers being assisted in keeping to their list rates by the firmer and more binding agreements amongst themselves.” And it is a fact that Cleveland bars (which were not in the combine) only rose from £6 2s. 6d. to £6 15s. between January 7, 1905, and January 7, 1906, while ship plates rose from £5 17s. 6d. to £7, and boiler plates from £7 2s. 6d. to £8 5s. When prices sank all round in 1907 plates went down more slowly, and with much longer pauses, than raw material. The East Coast prices were:⁶²¹

	Haematite per ton. £. s. d.	Ship Plates per ton £. s. d.	Price Unchanged for
January 1907,	4 2 6	7 10 0	
October	3 18 0	7 10 0	8 months.

November	3 16 6	7 0 0	
December	3 9 0	6 10 0	
February 1908,	2 17 0	6 10 0	3 months
March	2 19 0	6 5 0	
June	2 17 0	6 0 0	
December	2 16 0	6 0 0	7 months

These figures show that the price of regulated ship plates only followed that of unregulated crude iron hesitatingly and at a considerable distance. Shipbuilders complained⁶²² loudly of the “high” prices of raw material; “although to secure any orders at all for new ships they had to cut prices very low indeed, it was long before the respective combinations of English and Scotch steel manufacturers which act in unison would meet the situation.” Their complaint shows the influence of the monopolist organisation. How far it is easier now than the days of more open competition to maintain the price of finished steel in a falling market can only be seen with certainty when prices have further developed.

The manufacturers of galvanised plates, one of the chief English steel exports, are organised in very much the same way as those of ship and boiler plates. There is a similar body, the National Galvanised Steel Makers’ Association, with a similar origin from local associations, and a similar history of attempts to control prices and production in the year of falling markets. In January 1908 a meeting of the association adopted a price of £12 10s., free on board, Liverpool, as a basis, and this price was maintained unaltered throughout the year in the Midlands as well as in South Wales and the north, a fact, as a trade paper put it, which bore witness “to the smooth working of the Association.”⁶²³ It must be admitted that the small number of the important firms in each district made it comparatively easy to abide by the agreements that had been made,⁶²⁴ but the fact remains that prices maintained a steadiness for a whole year of bad markets to be sought in vain elsewhere in the entire iron and steel trade.

The tin-plate bar combine, the South Wales Siemens Steel Makers’ Association, has to give much more consideration to the pressure of possible foreign competition in fixing its prices. In this case the conditions are very favourable to a common organisation. Production is practically concentrated in South Wales,⁶²⁵ whose tin-plate industry is the main consumer; while, according to Rylands, the number of

firms making tin-plate bars in South Wales was in 1906 only thirteen. For some years German dumping, on which much valuable light was thrown by the German enquiry into cartels,⁶²⁶ rendered a monopolist combination of these firms pointless. When this ceased in 1904, the cartel movement began to spread among producers of bars. In 1906 a definite organisation was set up by the founding of the South Wales Association. Complaints soon arose that the association had driven up prices.⁶²⁷ But falling markets and renewed German competition made it impossible to continue successfully the device of a minimum price so well known in other branches of the steel trade, and Bessemer bars which stood at one time in 1907 at £6 10s. sank in January 1909 to £4 8s. 9d., an even more pronounced drop in prices than that in the other branches of steel which we have described.⁶²⁸

It would be natural to add here some account of the rails cartel, which is of very great importance among English steel trade associations; but in view of the fact that it depends on an international agreement the details may be postponed. Nor shall we now consider smaller local associations aiming usually at turning a local advantage in freights to the best profits which exist in various branches of the trade, or the undoubted fact that the big firms in each district to some extent “work together” and have understandings as to prices in many large orders. Such understandings, which always exist where production is concentrated in a few hands, have nothing in common with real monopolist organisations. They are of merely local effect or only brief existence, perhaps for some acute crisis. The really important steel monopolist combinations have all been reviewed.

The conclusion which we may draw from this general review is that, as matters now stand, a by no means negligible part of the steel and iron trade is organised on monopolist lines. Ship and boiler plates, galvanised plates, tin-plate bars and rails, represent in all a yearly output of about 3 to 3½ million tons, and the syndicated products are therefore considerable in amount. On the other hand, it must not be forgotten that the entire crude iron trade, together with manufacture of billets, blocks, iron bars, strap iron, angles, tubes, tin plates, and similar articles, are still free from any form of cartel, though in some cases it seems imminent.

THE INDUSTRIAL SPIRIT CARTEL.

Here again the impetus necessary to create a cartel was given by the decline of foreign competition after 1903. In 1902–3 not less than 1,212,000 proof gallons of

methylated spirit were imported into England: in the following years, mainly owing to changes in production and markets in Germany, imports fell to 334,000 gallons in 1904 and to only 4300 gallons in 1907–8. At the same time the home production rose from 5,388,000 gallons in 1903–4 to 6,455,000 gallons in 1907–8.⁶²⁹ Increasing immunity from foreign competition, due to the constantly rising price of foreign spirit, soon led to a combination of the few competing firms. For many years concentration had been at work. The Distillers' Company, for instance, which was mainly concerned with whisky distilling, was due to a fusion of seven Scotch firms in Edinburgh as far back as 1877. And it was now, therefore, only necessary to bring eight large distilleries into line to control the entire manufacture of industrial spirit in the United Kingdom.

In November 1907 seven of the eight existing firms founded the Industrial Spirit Supply Company,⁶³⁰ with a capital of no more than £1000, the shares being taken up by the constituent firms. The eighth remaining firm entered into an agreement with the new company. The loose compacts already existing were replaced by the definite regulation of output and sales. The company managed the entire industrial spirit sales of all the firms in the cartel, as no spirit could be bought for methylation except through it. It regulated the production of each firm according to an allotted quota proportional to the number of shares it held, and fixed the common prices. It further distributed orders among the individual firms after duly considering freights, a practice which was expected when the cartel was founded to produce considerable economy. A difficulty arose from the fact that a number of distilleries themselves manufactured methylated spirits, while others sold their spirit to finishers through agents who required to be paid; but the resulting advantage of the "mixed" distillery was met by a provision in the articles of association that it must pay to the funds of the cartel an amount per gallon produced equal to the agent's commission.

The founding of this cartel immediately resulted⁶³¹ in agreements among buyers as to a minimum price for methylated spirit. The circle was thus completed, and definite monopolist organisation from raw material to finished product achieved. After the approved fashion the cartel at its foundation foreshadowed steady, moderate prices; but within two years its success gave rise to loud complaints of its operations. It was accused of not lowering its tariff as it should have, in view of the provisions of the Finance Act of 1906, which reduced the duty on industrial spirit, and of having, on the contrary, raised the price of methylated spirit from is. 8d. to 2s. 2d. since the

passing of the Act. The London distilleries put the blame on the high price of raw materials, especially maize, but the Manchester Guardian's correspondent estimated that the manufacturers, in spite of that, succeeded in obtaining "a highly satisfactory difference between price and cost," due solely to the strong position of the cartel.

Once again the sole restriction on the manipulation of prices by the cartel is the possibility of foreign competition. The trade circular found comfort in this in its account of the cartel's foundation for the fears it very clearly felt on behalf of the ultimate consumer. "Happily there is a constant check at present existing in the German article, which will be always on the watch to come in if the price here of the British article is unduly pushed upwards.⁶³²... At present the combine would be quite safe at some pence higher, but it is quite likely that in another six months to a year the volume of German production may again bring down the figure over there to a dangerously low point." The combine had always been prepared to lower prices under pressure of foreign competition, but for the moment it had none to face, for raw potato spirit which cost 16.90 marks per 100 litres rose in 1907 to 28.20 marks.⁶³³

The high German prices enabled the associated English producers to raise their prices in a way which would have been hardly possible with a simultaneous reduction of the duty in former competitive days.

THE WALL-PAPER TRUST.

Although, as we have seen, the paper trade had never offered a hopeful field for monopolist combination on account both of foreign competition and of the still considerable number of competing works, in 1900 a fusion of 31 wall-paper factories, under the name of the Wall-paper Manufacturers Ltd., was effected. According to Mr. Macrosty,⁶³⁴ the trust had working agreements with three other firms, and controlled about 98 per cent, of the production of wall- paper and other decorative materials. In 1908 only seven manufacturers, according to Mr. Philips' statement, appeared as outsiders to the trust.⁶³⁵ This branch of the highly finished paper industry was therefore distinguished from the rest of the trade by close concentration of undertakings, and consequently suited for the formation of a trust. It was also the least threatened with foreign competition. Experts have told me that most English wall-paper makers, owing to the high quality of their goods and the peculiar dimensions current in England, have nothing to fear from the foreigner, except that the cheaper and inferior foreign papers might take the place of the English

if the price of the latter became very high. This also explains the fact that while England imports and exports wall-papers in about the same quantity, the value of the exports is considerably greater. This is especially true of imports from Germany. In 1908 they amounted to 19,000 cwts., valued at £37,000, while the total English exports were 83,000 cwts., valued at £217,000. At the same time the possible importation of certain qualities from Belgium and Holland reduces the scope of the trust's operations on prices to a fairly narrow limit. It has to content itself with hindering such decline of prices as might result from home competition.

THE CABLE CARTEL.

On the whole the electrical industry shows far fewer signs of trust or cartel building in England than in Germany or America. It belongs, generally speaking, to the sphere of free competition. It is especially subject to foreign competition. Imports of electrical fittings and apparatus (excluding machines and wires) have risen from £242,000 in 1897 to over £1,000,000 in the years 1905, 1906, and 1907. In the same three years the imports of machines were worth between £500,000 and £600,000. The predominance of foreign countries is due firstly to the greater reputed utility of German, Belgium, or American goods (a fact often neglected or underestimated by complaining British producers, but supported by adequate expert testimony),⁶³⁶ and secondly, to the economic advantages of foreign countries which enable them to produce and place on the market various electrical goods at a cheaper rate than the English makers.⁶³⁷ The causes of the backward state of the electrical industry in England are various. Some find the main cause that checked its development in the over-favourable purchase terms granted by the legislation of the early eighties to local authorities.⁶³⁸ Others attribute it chiefly to the want of technical education.⁶³⁹ Prof. Chapman recalls⁶⁴⁰ the fact that production in England is not connected with so important a demand as in America and Germany, and that therefore less use has necessarily been made of division of labour and of technical improvements. To which we must reply that it almost seems as if it were the other way round. It is not the comparatively small total output that explains the backwardness of the English electricians, but the want of technical skill which prevents them from enlarging their market, especially abroad, and delivers them more and more over to their rivals. Finally, many manufacturers attribute it to the high wages prevalent in England, to dumping, and to systematic favouring of foreign makers by English local authorities,

and accordingly demand a protective tariff.⁶⁴¹

Whatever the real reason may be, the English electrical industry is certainly not in a position to shake off foreign competitors, and far from fixing their prices in the English market, has to try to adapt itself to the low prices of German, Belgian, and American firms. There is no doubt that the tenders of British firms for large orders have never yet been lower than those of foreigners,⁶⁴² so that foreign rivalry has made illusory any prospect of raising prices by a general suppression of competition, and the attempt has, therefore, never been made, not even by means of an association to regulate tenders.

Apart from this decisive proof of the hopelessness of combination, the average capital of an English electrical undertaking is so much less than it is abroad that there seems very little possibility of suppressing competition. Mr. Hirst, a representative of the General Electric Company, has recently drawn public attention to the degree in which the various firms specialise, a fact he attributes to the extreme subdivision of municipal orders. As a result, each single undertaking represents a smaller concentration of capital than the large German combined works.⁶⁴³ The large number of undertakings, — which is no doubt also to be explained by the backward state of technical developments — would therefore be a considerable difficulty in the way of a monopolist union, even if foreign competition were smaller.

These general characteristics accentuate the exceptional position of the one branch of the English electrical industry which exhibits at the present time the conditions necessary for creating a monopolist organisation. The cable industry — under which term we include, for simplicity's sake, the production of current conductors, power cables, telephone and telegraph cables, electric wires, and so on — is, unlike all other branches of electricity, still far superior to its foreign rivals.⁶⁴⁴ It has also a considerable export trade. The total value of electrical exports (excluding machines and iron or steel telegraph and telephone wires) amounted in 1908 to £1,942,106, of which wires and cables alone accounted for £1,225,934.⁶⁴⁵

For this foreign market England has chiefly to thank its colonies. They require a very superior quality. And other countries, whose production is largely restricted to cheaper and comparatively inferior wire, have not been able to satisfy the demand. Moreover, in England itself consulting engineers prefer English wires,⁶⁴⁶ which have, therefore, in practice the advantage of a monopoly in the English market.

The exploitation of this advantage by a monopolist organisation is further

simplified by the fact that in this case, again in contradistinction to the general condition of the electric industry, only a few large firms have to be considered. Their size, originally considerable, has much increased in the last ten years. The well-known Callender's Cable and Construction Company has now a turnover of £1,000,000, as compared with only £100,000 to £150,000 ten years ago. "A small firm," their representative recently stated, "cannot do electric cable work. To begin you must have; £500,000."⁶⁴⁷ Moreover cables can be standardised, which further adds to the ease of a union of competitors.

The Cable Makers' Association started as early as 1898. It was made clear that further competition would lead to depreciation of quality, and this was to be avoided by fixing a minimum price.⁶⁴⁸ At the present time the association includes sixteen firms,⁶⁴⁹ but some of them are amalgamated, and the number of separate firms is, therefore, really smaller. From what is known of the association it may be taken that it controls 90 per cent, of the total production. In any case the outsiders cannot check the fixing of a minimum price, which is the real function of the combine.⁶⁵⁰ The installers of electricity, who are the chief buyers, have arrangements of a somewhat peculiar kind with the combine, inasmuch as they receive a fixed discount on purchases from firms connected with the combine if they are members of the Electrical Contracting Organisation, an association embracing the whole country.⁶⁵¹ In other words, there is a counter-organisation of consumers, occupying by virtue of combination a stronger position in face of the combine than each individually could obtain.⁶⁵² But this attempt to modify the combine's control of prices has not suppressed complaints of excessive charges.⁶⁵³ In view of the considerably superior quality of the English product, it is very difficult to establish a comparison between the English and foreign prices,⁶⁵⁴ but it is ominous for the combine's control of prices that in recent years there has been a not inconsiderable importation of foreign cables and wire, while formerly the English market was supplied by home makers alone. The imports were of inferior quality, but the much cheaper foreign wire seemed, in view of the home prices, more and more to attract certain consumers in spite of its inferiority, and in this way, as in the case of Portland cement, a competing substitute began to threaten the combine. In 1905 the original standardisation had to be abandoned, and members were allowed to manufacture inferior qualities, to be known at sales as Non-Association Cables.⁶⁵⁵ This state of affairs still continues.

So far we have considered a number of monopolist associations in which the

decisive factor was the possibility of foreign competition. In many cases it could be shown that to exceed the price at which it became profitable to import led to bitter disappointment for the promoters. Before passing to the group of associations enjoying what we have called unconditional immunity from foreign competition, we must emphasise the fact that, strictly speaking, the distinction is only relative. There is no industry which, when prices reach a certain degree of exorbitance, can remain immune. Even the German potash industry, for instance, which is based on a product mined from a natural state in Germany alone, would, if prices were high enough, have to fear the importation of foreign artificially produced alkalis. But long before this point was reached, the high prices would cause such a slackening in the demand or such an increase in competition that no monopolist organisation could start such a policy without greatly damaging itself. It is this fact, that there are industries in which the independence of the monopolist is limited by other circumstances long before foreign competition comes into play, and in which therefore monopolist associations can fix the maximum price which suits them without considering possible importation, which we have in mind in using the term unconditional immunity from foreign competition.

SALT TRUST AND SALT SYNDICATE.

Of the chief mineral raw products of England, three only — coal, stone and earth, and salt — occupy monopolist positions in the home market through low cost of production and favourable market conditions. We have seen the reasons which prevent an organised attempt to profit by this position in the case of the first two, but English salt works have been for years ruled by monopolist associations.

Like coal, salt has remained, in spite of growing production abroad,⁶⁵⁶ an important export. In the last fifteen years a yearly average of from £400,000 to £500,000 worth has been exported from the United Kingdom; while even when prices were high, as in 1888 and 1889, importation seems to have been out of the question.

So far as foreign competition was concerned, all the necessary conditions for the rise of a monopolist organisation were therefore fulfilled; but this only served to bring into greater prominence the difficulties which the home trade offered for any such project. The great number of salt deposits seemed to render a monopoly completely impossible, while for a long time salt businesses were not so large as to make any very great demand in the way of capital on a new undertaking. The change

only came with the keener competition of the eighties. Works which, to reduce the cost of production, provided their own transport began to be differentiated from those which did not do so. Though it is not possible to give statistics to prove that this development led to industrial concentration, nevertheless the combined undertakings occupied such a commanding position against other works that most of the smaller firms were compelled to join them to escape annihilation. Sir A. Mond, whose knowledge of the circumstances is complete, tells me that it was this that commenced attempts to form a combine. As salt, unlike coal, was practically concentrated in one county, Cheshire, it was relatively easy to form understandings, and this culminated in 1888 in the formation of the Salt Union, a trust of sixty-four firms embracing about 90 per cent, of the production. The number of firms included in the trust was comparatively large, but it must be remembered that they were by no means all of equal weight, so that the number of really important competitors joining the combine was far smaller than these figures would at first suggest. The prospectus of the Union, which enumerates⁶⁵⁷ among the property of the undertaking such things as steamers, boats, locomotives, railway lines and trucks, quays, and landing-stages, shows how far separate firms had developed industrial combination in the matter of transit. The immediate result of the formation of the Salt Union was an enormous rise in the price of salt. If we compare the prices shown by the value of the exports we find they were as follows:⁶⁵⁸

	Export Price per ton. s.
1878–1887	12.65
1888	10.81
1889	16.15
1890	17.98
1891	17.77

Allowance must be made for the great increase during these years in the price of coal, which represents 80 per cent, of the cost of production. But while the pit price of coal in Cheshire only rose from 6s. in 1881 to 8s. 6d. in 1890, the works price of salt rose in the same period from 6s. 0¾d. to 10s. 3d.⁶⁵⁹ The combine could not, it is

true, permanently maintain the high prices, and in the nineties they fell again considerably. But up till now they have not again reached the low level of the eighties, though the export price sank temporarily to only just above 13s. in 1898.

Higher prices and annually improving profits, however, led to an increased number of outsiders. When the Union was formed the directors anticipated an output of 2,000,000 tons, the total production being then (1887) 2,206,000 tons.⁶⁶⁰ In 1907 the total output of the United Kingdom was 1,984,656 tons, to which the Salt Union contributed only 909,000!⁶⁶¹ But as a very considerable portion of the country's output of salt was still concentrated in the Union, no insuperable difficulties existed to agreements between them and the outsiders. Such agreements began at the end of the nineties, and became more definite after 1900, when the Union and the outsiders actually agreed upon a division of production between them.⁶⁶² In 1905, however, these still fairly loose compacts came to an end, and an immediate fall in price followed, export prices sinking from 16.36s. in 1904 to 14.22s. in 1906. But the prophecy of the Union chairman in 1905 that "outside makers would see that it would be more profitable to work half or two-thirds of their pans at a profit than work the whole at a loss," was soon fulfilled. In the autumn of 1906 both interests combined to form the North-Western Salt Company, a syndicate which now regulates the sales both of the Union and the outside makers. According to the statement of its first chairman, Mr. G. H. Cox, at the annual meeting of the Salt Union on the 27th March 1907,⁶⁶³ all the salt-makers and wholesale dealers, with a few exceptions, joined the undertaking. As in the case of the Spirit Supply Company the share capital is small (£10,000 in £1 shares). Each member has an allotted quota of production, a "basis of tonnage," and the actual output of each firm is dependent on the total output fixed, a system which vividly recalls the Newcastle Vend. Each firm is represented by one director in the syndicate, the Salt Union on account of its importance having two.

The effect of the syndicate was soon seen. As early as the second half of Sept. 1906 a trade paper announced⁶⁶⁴ that "a meeting of the [N. Western Salt] Company was held at which the prices of salt were reviewed, and where ever the absence of contracts made it impossible they were increased by small amounts ranging from 3d. to 6d. per ton." Export prices rose from 14.22s. in 1906 to 15.52s. in 1907, an increase partly justified by the higher prices of coal, but never approached before the days of the syndicate; and the profits of the Salt Union increased from £87,000 in 1906 to £127,075 in 1907, the output of salt being practically the same. This was the

largest net profit since 1896.⁶⁶⁵ Although the Union's "efficiency" combination increases the demands made on new undertakings, the possibility of new rivals will always influence the salt syndicate's regulation of prices. It is undoubtedly the case that monopolist organisations in the English salt industry have sensibly affected home prices. When the syndicate arose in 1907 it was stated at the general meeting of the Salt Union on the 27th March that "a thoroughly sound and practical working scheme for regulating the tonnages and prices of the salt trade as a whole had been found." In 1909 the Union reported⁶⁶⁶ that "the North-Western Company which regulated prices had worked effectively." It had "carefully considered the circumstances attending the trade at home and abroad, and had from time to time arranged prices accordingly, so that they might rest assured that no markets had been lost by an attempt to exact too high prices. On the contrary, especially low ones had been agreed to in several instances where there was a prospect of opening out fresh channels of trade or retaining old ones in the face of competition." The report clearly shows how absolute the power of the syndicate over prices is, and recognises its expression in the different treatment of different markets according to the interests of the company. That English salt-makers dumped even before this date can certainly be proved; and at times complaints against them were as rife on the other side of the Atlantic as among English manufacturers at the dumping of American trusts.⁶⁶⁷

THE FINE COTTON SPINNERS' AND DOUBLERS' TRUST.

The English textile industry is, so far as the greater part of its products is concerned, very firmly entrenched against foreign competition. Certain branches like silk weaving may be exceptions, in certain cheaper qualities competition from abroad may have much increased of late, but such facts cannot in any way overshadow the economic superiority of this very important branch of English manufactures. The Reports of Mr. Chamberlain's Tariff Reform Commission, it is true, bring these discouraging signs so much into the limelight that one is almost induced to regard them as more than mere exceptions. To quote but a few of the Commissioners' opinions from their Report on the woollen industries,⁶⁶⁸ we find it, for instance, stated that "Great Britain has lost one branch of trade after another, until there is now practically no foreign market in which the firms who have given evidence before the Commission feel themselves secure.. .. The export trade of British woollen manufacturers is being step by step reduced to one in special articles and fancy

goods, or of raw materials and half-manufactured articles.... The profits of the home trade have diminished by increased competition amongst themselves and by foreign importations. The home trade, therefore, has tended to become more insecure during recent years. This state of insecurity makes it more and more difficult to get new capital into the trade, to build new mills, or to maintain in the proper state of efficiency those that already exist.” The unsophisticated reader of such statements, innocent of the fact that they must be intended to prove that English textiles need protection at any price, might actually believe textiles to be “going.” But he will gain quite a different impression if he studies the export statistics of textiles rather than the ex parte statements of certain selected firms, which could by no stretch of imagination be regarded as representative of the textile trade. The average annual exports in round millions sterling were:⁶⁶⁹

	Exports.		Imports.	
	1893–1902.	1903–1907.	1893–1903	1903–1907.
Yarns and cotton goods,	67.7	91.2	5.0	9.2
Woollen goods,	23.5	28.1	13.3	13.2
Other goods,	11.7	13.4	19.2	19.3
Total,	102.9	132.7	37.5	41.7

These figures show, in the first place, that English textile exports have of late years considerably increased, and have risen much more in the aggregate than imports, and secondly, that it is just in the most important export branch of textiles (accounting for three-quarters of the whole textile exports) that importation, which in the last five years only represented about one-sixth of the value of the export in the ten chief textile trades, is almost entirely negligible. English textiles, as a whole, are therefore not exactly “overtaken” or “endangered” or “driven from the field” by foreign competition. But the real importance of the statistics can only be seen when we remember the kind of exports in question. English textile manufacturers have been wise enough to turn lately more and more to the making of high-quality goods, in which they are unsurpassed in any other country; and this has enabled them to compete even behind the high tariff walls of America and the Continent while preserving their English market in such goods unchallenged.

Experts and scientific writers have so frequently discussed the facts of this

phenomenon and admitted their correctness⁶⁷⁰ that it is here only necessary to draw attention to it. A further proof may be added, though it is one which at first sight may raise suspicions, as it comes from the mouth of the Tariff Commission. In view, however, of the Commission's object it is especially important to notice that even they had to recognise the world-wide superiority of English textiles in high-grade goods, and we may quote their statement, which is clearly quite disinterested, as a remarkable testimony to the truth. Their Report, in dealing with Bradford, says:⁶⁷¹ "In certain classes of goods witnesses state that Bradford manufacturers can beat any producer in the world." Similarly, with regard to Huddersfield a witness stated:⁶⁷² "The export trade in the very best goods has not suffered to any great extent; there is a superiority in the make which is so great that the public abroad will buy the goods whether they cost 10 per cent, more or 20 per cent, more." The Commission represents such facts, which could hardly be passed over in silence, as being merely of minor importance, and implies that England only retains her former textile superiority in luxuries. But as the witnesses were largely persons who manufactured or dealt in secondary qualities — these being the only sufferers in the English textile trades and the only protectionists — the evidence gives the impression that the industry chiefly produces goods of the same value as the German, Belgian, or American articles. The authorities we have cited above, however, all show that the great majority of English textiles reach a quality beyond that achieved abroad, and this not merely in the matter of special articles or fancy goods. The whole English industry is up to this standard of excellence, and only sinks beneath it in rare instances where the manufacturers lack skill and adaptability.⁶⁷³ Those kinds of foreign woollen and worsted yarns, for instance, which are yearly consumed in Bradford, the centre of the wool industry, are not produced in Bradford at all,⁶⁷⁴ and do not compete with the main home production. It is the same with woollens. In 1907 woollens made up £5,600,000, or more than half the total value of all wool and worsted imports. They cost 1s. 6.24d. a yard, whereas the three most important exported woollen cloths cost an average of 43. 11.6d., 1s. 11.17d., and 3s. 7.44d. a yard, and represented a total value of £8,000,000. If we turn to cotton, we find the import figures show that cotton yarns varied in the last five years from 9.80d. to 11.74d. per 1 lb., while the export prices in the same period were from 11.74d. to 15.21d. per 1 lb.

The fact that the English textile industry possesses, owing to the high quality of its

goods, a world-wide superiority in most of its products is one of the main foundations of the monopolist associations now existing in the trade. Given the possibility of excluding home competition an association can always be formed. As we have already seen, this possibility does not always exist, because in the lower grades of both the cotton and the woollen and worsted industries the number of separate undertakings is so great, and the creation of new undertakings so easy, that the systematic restriction of competition and the raising of prices by a monopoly is out of the question. But the conditions in high-quality textiles are quite different.⁶⁷⁵

One of the most successful combinations in the textile industry is the Fine Cotton Spinners' and Doublers' Association. Founded in 1898 by the amalgamation of thirty-one firms, it soon after acquired further undertakings and practically controlled the whole English production. The association's prospectus itself claimed that the business had a kind of "monopoly value," and emphasised the fact that the old-established reputation of the amalgamated firms for expensive yarns "placed an obstacle in the way of new competitors." As to foreign competition, "the spinning and doubling of the finest counts require large experience and excessive care, and it can be only successfully carried on where the workpeople are skilful and highly trained. It is doubtless for this reason, coupled with the climatic advantages of Great Britain, that this branch of the cotton trade has not suffered appreciably from foreign competition."⁶⁷⁶ Owing to the comparatively small number of competing firms and the difficulties facing new competitors, this advantage can be fully used. The fact that though dozens of new mills started spinning during the great boom of 1907, they in no way competed with the fine yarns of the association shows that the expectations of the prospectus were not unjustified.⁶⁷⁷

THE SEWING COTTON TRUST AND SEWING COTTON SYNDICATE.

The Fine Cotton Spinners' Association arose out of the competition of a comparatively small number of firms of equal strength. In the derivative sewing thread trade concentration developed in quite a different manner. A single undertaking, J. & P. Coats, had grown from small beginnings in 1826 to a limited liability company, with £5,750,000 capital in 1890. In 1895 and 1896 four other firms of similarly extensive character were amalgamated with J. & P. Coats, with whom they had for many years been allied through a sales association. In 1897 most of the twenty smaller firms standing outside this immense undertaking united in forming

the English Sewing Cotton Company, which, after the inclusion of further firms in 1899, had a share capital of £3,000,000. The relations of these two great rivals were smoothed by the fact that Coats held some of the new company's shares. At the same time an American thread trust, "The American Thread Company," was formed, both Coats and the English Sewing Cotton Company holding commanding interests. The English thread trust, which now owned important factories in Spain, Canada, Russia, and other countries, besides America, thus acquired an international character.

Conflicts as regards sales between the rival large firms were, it is true, not entirely obviated by the holding of shares in common. But the decision of the Sewing Cotton Company, whose position was far less assured than that of Coats, to sell their products in association with the latter through the Central Thread Agency, brought greater unity. As in the salt trade the syndicate with its common sales led to a close connection between the trust (Coats) and the outside makers, here concentrated in a single undertaking (The Sewing Cotton Company). The strength of the combine in foreign markets is due to the special nature of the articles it sells. "Our strength," declared the Report of the Sewing Cotton Company in 1908,⁶⁷⁸ "lies largely in the fact that the names and brands of our various goods are asked for by consumers in so many parts of the world." This is even more true of Coats. "In spite of foreign tariffs, and of foreign competition, we hold our own."⁶⁷⁹ Undoubtedly it exercises a great influence on prices, and knows that it can fix them at its will without being hindered by any consideration except the elasticity of the demand, as the above report shows. "As far as possible, we have avoided a policy of high selling prices that would tend to lessen consumption or dissatisfying our customers." Whatever the customers may have thought of the prices, their monopolist nature is shown by the fact that they resulted not from the workings of competition, but from systematic regulation by the chief makers.

BLEACHING AND DYEING TRUSTS.

In the bleaching industry the trust, the Bleachers' Association, depends for its chief protection against external competition on its monopoly of the water supply.

As the association's prospectus puts it, "the great and ever-increasing difficulty of obtaining a sufficient water supply makes the position of established bleaching works very strong, whilst the laws against the pollution of water work against the erection of new works." Advantage had already been taken of this peculiar monopoly

possessed by the works round Manchester to make agreements as to prices long before the formation of a closer organisation in 1900 in the Bleachers' Association, a union of fifty-three firms. Similar circumstances led to the formation of the Bradford Dyers' Association in 1898, which also resulted from the organisation of an existing local monopoly. The conditions which favoured this development are clearly set out in the prospectus.⁶⁸⁰

They were (1) freights, which secured undertakings near Bradford from external English competition; (2) the necessity of close local connection between dyers and their customers, a factor which enhanced the value of this advantage in freights; (3) the special qualities and abundance of the water supply; and (4) the existence of a limited class of workmen for high-grade work. On these grounds the Dyers' Association considered their position "almost unassailable." As 90 per cent, of the production was in the hands of twenty-two firms, the formation of a combine was easy. In 1903 thirteen more firms joined, and the monopolist organisation became complete. In this case, therefore, a much more complete concentration took place than in bleaching.

The Dyers' strong position and their intentions as regards prices were to a certain extent revealed in the 1898 prospectus, which, though like that of the sewing thread combine attempting to reassure consumers, bore emphatic testimony to the possibility of regulating prices without competition. "Whilst it is apparent that the inclusion of about 90 per cent, of the entire trade within this Association amounts to what is practically a monopoly, the directors recognise that the interests of the Company are largely identical with those of the manufacturers and merchants of the district, and though there are no doubt cases in which some readjustment and regulation of rates are clearly reasonable... it is no part of the present scheme to inaugurate an era of inflated prices." Similar language was used by the chairman of the company in 1904:⁶⁸¹ "We have ever refrained from the adoption of those forcible methods which are a temptation to the executives of large organisations. We have never taken unto ourselves the role of monopolists." But the buyers do not seem to have declared themselves entirely content with the prices actually charged. On the contrary there were so many disputes that the Bradford Chamber of Commerce managed to get a central agency between the combine and its customers established. This agency, the Bradford Piece Dyeing Board, was composed of merchants and of members of the association, and aimed at forming price agreements running for considerable periods

of time, and harmonising the interests of both parties.

Mr. Clapham, who justly calls the Bradford Dyers “the most successful of British industrial combines,” quotes a number of facts showing their commanding position in regulating production and markets, and he rightly explains the creation of the above agency as due to the imperative necessity for merchants to cultivate “friendly relations” with this powerful organisation.⁶⁸²

An interesting account of the association’s attempts to differentiate prices is quoted by Mr. Macrosty⁶⁸³ from the *Yorkshire Post*. Contracts were made with merchants under which they were bound to send all the goods which they required to have dyed to the combine. The merchant might make exceptions, but he had to enumerate (i) the classes of goods to be excepted, (ii) the outside firm in whose favour the exception was made, (iii) the amount of goods to be left them, and (iv) the reasons for so doing. If he agreed to these conditions, the combine could see at once the strength of its position in each branch of the trade, and adopt its different scales of prices accordingly. But after a while dealers began to regret such contracts, and this ingenious system of attacking outsiders came to an end.

The cotton and wool dyers’ combine, the Cotton and Wool Dyers’ Association, formed in 1900 by the amalgamation of forty-six firms, is less powerful. As the association dyes all kinds of yarn, not woven materials, and does not, like the Bradford Dyers’ Association, make special articles of particular reputation, the original position of the separate firms was not so secure as at Bradford; whilst any manufacturer using yarns could make himself independent of the combine by erecting his own dyeing works, especially if he only made plain cloth and simple blue or black stuffs.⁶⁸⁴ This branch of dyeing is moreover scattered over several districts — the combine has works in Lancashire, Yorkshire, and Glasgow — which makes it more difficult to make arrangements with new outsiders than in a locally concentrated industry like that of Bradford. It is, therefore, not unnatural that the cotton and wool dyers have been much less successful financially and in fixing prices than the Bradford dyers.

THE CALICO PRINTERS’ TRUST.

The bleachers’ and dyers’ associations threw but little light on the tendency to industrial concentration. The associated firms represent of course but a small number of undertakings, though they amount to some dozens in all, but it cannot be shown

whether the immense size of the united undertaking in fact impedes the rise of many new competitors. The difficulty of founding new firms is due far more to the peculiar circumstances of the water supply, the demand for known patterns, and the need of a special race of workpeople. It was facts such as these which secured to the not very numerous existing works a monopolist position, and considerations of what was the most efficient unit of size for a bleaching company or dye works.

With calico printing matters are different. Forty-six manufacturing firms were included in the Calico Printers' Association when it was founded in 1899; and this would at first sight lead to the conclusion that there had been no very strong concentration, none at least at all comparable to that in the steel and iron trades. But we can prove⁶⁸⁵ (what is not always possible) that these forty-six firms were of very varying competitive power. In all they owned 830 printing machines and produced about 85 per cent, of the calico printed in England. Seven of them owned 350 machines between them and represented 36 per cent, of the total production. Gartside's alone owned 74.⁶⁸⁶ As early as the end of the nineties many undertakings no longer paid, and by June 1905 no less than 20 factories were closed. The number of undertakings of serious moment in 1899 was therefore much smaller than might be supposed from the list of firms included in the association. It further appears, if we investigate the dates at which the associated undertakings were founded — and this is typical of the movement to concentration — that 37 of them were founded before 1860, 5 between 1860 and 1880, and 4 after 1880. To all appearances the most recently founded were smaller concerns, for they only employed 6 or in one case 13 machines. Possibly they supplied some particular demand. These figures only include firms still existing after 1898, and even so are not complete, but they clearly show how slowly in recent years the number of firms in the calico trade has increased.

Concentration and the survival of a very small number of the most efficient undertakings facilitated the combination of the majority of existing works. On the other hand, the Calico Association is now an "efficiency" combination with which no single firm, even if of suitable size for economic working, could easily vie. The expense of acquiring new inventions and discoveries, or of securing the best designers and prickers is excessively great for a single firm; whilst the combine, by supplying the needs of a number of works at one and the same time, is in a position to satisfy these important requirements in calico printing at the very lowest cost.

The calico trade, being one of the main textile exports, is quite secure from foreign

competition. It fixes the world's price and, especially in specifically English qualities, holds a monopoly in the home market. Under the regime of the association exports have increased. Between 1897 and 1899 the average annual exports of printed cotton goods were about 800,000 to 1,000,000 yards, between 1905 and 1907 1,000,000 to 1,200,000 yards. The considerable rise in the prices of exported printed cottons since 1898 is especially remarkable. The following table shows the export prices of those cotton goods whose manufacture is controlled by trusts, in bleached, dyed, and printed pieces, compared with the import price of cotton and the export price of ordinary cotton yarns.

Year.	Import price	Export price of	Export price of cotton			
	of cotton per lb.	cotton yarn per lb.	pieces per yard,	bleached.	dyed.	printed.
	d.	d.	d.	d.	d.	
1895	4.16	8.46	2.21	3.30	2.53	
1896	4.96	9.48	2.31	3.36	2.58	
1897	4.48	9.06	2.26	3.39	2.60	
1898	3.85	8.34	2.20	3.18	2.49	
1899	4.80	8.77	2.21	3.16	2.43	
1900	5.59	11.61	2.43	3.54	2.64	
1901	5.51	11.15	2.46	3.57	2.73	
1902	5.44	10.49	2.46	3.46	2.68	
1903	6.00	11.74	2.54	3.54	2.74	
1904	6.71	13.12	2.63	3.84	2.91	
1905	5.68	11.99	2.67	3.78	2.86	
1906	6.67	13.88	2.81	4.02	3.00	
1907	7.08	15.21	2.89	4.35	3.15	

We do not know what proportion the cost of raw materials bears to that of the finished goods, and we cannot, therefore, judge from these figures whether the increased price of the manufactured goods was entirely justified by the rise in the price of raw materials or not. It is clear that the increases in bleached, dyed, and printed goods are primarily explicable as a natural consequence of the exceptional

price of cotton, but whether the trusts have engineered a more than corresponding increase in prices is mostly uncertain. It is remarkable that the export price of bleached cotton goods, which until 1900 followed the fluctuations of cotton and of yarn exports, since that year (in which the trust was founded), has risen steadily and independently of the fluctuations of raw materials. But it will be some years before the trust's effect on prices can be really judged; more especially we must wait till the prices of raw materials sink again to see whether the manufactured goods fall as low as they would have in the days of competition, or whether the monopolist associations can then maintain higher prices.

THE LOCOMOTIVE TRUST.

The monopoly of the home market held by English textiles is obviously due to their excellence and their comparative cheapness to produce. Several other English industries temporarily enjoy similar advantages, owing to peculiarities in the demand which exporters in other countries working to a more uniform standard cannot satisfy. This is the case in locomotive building. Certain American engines were at one time sold in England, but the conditions of traffic made it impossible to use them to full advantage, as would be done in America, and the attempt to import was not repeated.⁶⁸⁷ The special requirements of railway companies' engineers as regards construction hamper makers by preventing uniform standardisation,⁶⁸⁸ but they also make foreign competition difficult. That is the reason why, as experts testified before the Tariff Commission, foreign engines are only imported for English use in quite exceptional cases; and why the representatives of the industry desired no kind of protection in the home market.

The number of locomotive works thus monopolising the home market was in 1908 only eleven; but as many railway companies own their own works, these eleven works only cover part of the demand.⁶⁸⁹ Three undertakings were amalgamated in 1903 into the North British Locomotive Company. Of the 20,840 workmen engaged in 1908 in the above eleven works, the North British alone employed 7,192, and five other works about 11,000, so that these six firms accounted for nearly the whole production of locomotives.

The North British Locomotive Company certainly occupies the dominant position which in America would be held to justify the name of trust. Its representative before the Tariff Commission could not avoid recalling the above-mentioned amalgamation

when the trust problem was discussed, though he spoke of it as aiming solely at economies in working. In a case like this, which is concerned with special orders, it is however very difficult to measure in prices the exclusion of competition, whilst in any case the policy of the trust is still subject to pressure from outsiders, even though these are not numerous.

THE WHISKY TRUST.

Whisky is another of the articles which enjoy a monopoly in the home market owing to certain peculiar qualities. It is a “national drink” as well as an important export in which there is no foreign competition.

The concentration of whisky distilling has been slow but steady. The “Distillers’ Company Ltd.,” of which we heard in connection with the Industrial Spirit Syndicate, and which has now matured into a trust, started as early as 1877 with the amalgamation of six Scotch firms. In 1902 and 1903 the company bought up three more distilleries, and acquired half the shares in the most important Irish distillery.⁶⁹⁰ In 1907 it purchased the Vauxhall Distillery Company, representing a share capital of £376,000, thereby increasing its possessions to seventeen distilleries in England, Scotland, and Ireland.⁶⁹¹ In Scotland, the chief distillery district, it had only two competitors, with whom it before long came to an understanding as to common prices.⁶⁹² As a result the Scotch Combine, as it was called for short, proceeded in the autumn of 1907 to raise the price, an action which called forth some interesting remarks from the correspondent of the trade paper.⁶⁹³ “The advance of twopence per gallon in the price of new whisky reported last month was sensational enough in its way, but not content with that it is now rumoured that the distillers meditate a further advance of a penny a gallon. One thing certain is that the distillers can advance prices by another penny just as easily as they advanced it by twopence last month Users will have to pay it, and get it back from their customers as best they may.” This appears to mark the crowning achievement of the company’s systematic efforts continued for several decades to form a combine. Here again the essential condition for success was that the number of firms in this important industry was for technical reasons so small that the amalgamation of seventeen firms secured to the company a “dominating position” over the whole whisky production of Great Britain.

BRITISH AND INTERNATIONAL RAIL SYNDICATE.

The prospects of industrial monopoly in England have recently been improved by a circumstance which points to a great development of cartels and trusts in the future. Industries hitherto exposed to foreign competition can now seek protection in international agreements. This opens up a possibility of securing the English market to the English producer, free trade notwithstanding, even where English goods do not surpass foreign goods in cheapness or quality. But even in these cases it has so far been an essential preliminary that concentration in England should exclude competition among home producers, and that similarly close monopolist associations should have been formed abroad with which international agreements could be made.

This condition was fulfilled at an exceptionally early date in the case of steel rails, which were concentrated earlier than the rest of the heavy iron trade in the hand of a few immense undertakings. Everything consequently favoured combination among the chief producing countries.

In the early eighties there were in England 18 to 20 firms which rolled heavy rails.⁶⁹⁴ In 1906 there were only 9 left, though production was about the same.⁶⁹⁵ A similar process of concentration has taken place in all other rail-producing countries, especially in the United States.⁶⁹⁶

As early as 1883 the English manufacturers formed an international rail syndicate with Germany and Belgium.⁶⁹⁷ The syndicate several times broke down, but latterly became more and more a permanent institution for the regulation of the international rail market. In 1905 the United States, England, Germany, Belgium, and France were all members. In May 1907 the syndicate was renewed for five years, and since then Russia also has joined.⁶⁹⁸ Great Britain, in which all the works except one belong to the syndicate, enjoys under the agreement the fullest security from the competition of its most important foreign rivals. Each country retains its own home market, while the export trade is so divided that each member of the syndicate receives a region in which he is free from competition. Naturally this agreement exercises a considerable influence on prices in England. When steel rails rose in 1907 from £6 15s. to £7, after costing £4 to £5 during the three preceding years, while at the same time American home prices were only £5 12s., a good many Englishmen began to realise⁶⁹⁹ that, free trade notwithstanding, the English price was no longer fixed by rates quoted in other exporting countries. Prices were clearly favourable for the export of American rails to England, but though a considerable number of rails were in fact exported from

America in 1907, none of them came to England. This was in sharp contrast to what occurred in 1900 and 1901. Then, too, English prices had far outstripped American, the average price in 1900 being \$36.01 in England against \$32.29 in America.⁷⁰⁰ As a result, American export statistics showed a growing and hitherto unknown export of rails to England.⁷⁰¹ In November 1900 a trade paper stated⁷⁰² that “for some time past the British Steel Rail Makers’ Association have kept prices up at £7 to £7 5s. per ton for ordinary heavy sections, but the Americans have been recently underselling them, and now the home makers have relaxed their conditions, and given freedom to makers to lower their prices at once. This has been immediately done, and some makers are quoting as low as £6 net for heavy sections.” In 1907 the difference in price between American and English rails was even greater, and, as in 1901, America exported about 300,000 tons; but the whole of Europe only received a beggarly 474 tons! — a clear testimony to the international syndicate, whose arrangements barred export to England.

The division of the export trade will also greatly affect English prices.⁷⁰³ If the regulation of international output is such that English producers can export the greater quantity of their goods, it is easier to maintain a high home price than if foreign orders have to be divided with other countries. The amalgamation of two important rail makers by the foundation in 1909 of the Workington Iron and Steel Company has lately strengthened the syndicate in England, and the exclusion of domestic competition seems, therefore, more than ever assured. But the position of the international association is weakened by the appearance of Canadian exports. As yet no agreement has been made with this newcomer.

THE SODA TRUST.

The present position of British soda manufacture is in so far peculiar that most works still use the Le Blanc process, which in other countries has been more and more discarded. The United Alkali Company, formed in 1890 out of forty-eight firms of which three were salt-makers, at the time controlled, according to its own statement, almost the whole of the Le Blanc works. Since then it has acquired further chemical and salt works and copper mines in Spain, and now represents a capital of almost £9,000,000.⁷⁰⁴

Two facts have, however, exercised an important influence on this combine, which in 1890 controlled about 90 per cent, of the English trade in soda and soda products:

first, the growth of soda industries abroad, and especially in Germany, based on the admittedly far cheaper ammonia process; and secondly, the increasing importance of the ammonia process in England itself — the chief opponent of the United Alkali Company in this latter respect being Brunner, Mond & Co., whose capital increased from £200,000 in 1881 to £2,789,650 in 1906.

Competition having thus become considerable, an international agreement became very desirable in the eyes of the company, and in 1900 the first steps were taken.⁷⁰⁵ It was not, however, till 1906 that an agreement for regulating prices and markets which did not fall to pieces on the first opportunity, was arranged. At present, owing to the understanding between the English combine and the continental makers on the one hand, and the close connection between Brunner, Mond & Co. and the Solvay Works, which dominate the German cartel, on the other, peace seems better assured than it used to be.⁷⁰⁶

In the case both of the United Alkali Company and of Brunner, Mond & Co., the production of raw materials is practically combined with manufacture. Working costs are, in consequence, exceptionally low, and the expense of founding new works to compete in manufactures considerably increased. It is hardly likely that new Le Blanc works will be set up in England, as the Le Blanc process has only proved to be superior to the ammonia process as regards certain bye-products.⁷⁰⁷ Nor is it much more probable that a competition of equal strength will rise up against Brunner, Mond's ammonia business, which is firmly established and admirably managed. Mr. Macrosty shows that in 1904 and 1905 — after the international agreement — there was great steadiness of prices in the heavy chemical trade, and this was fully maintained in 1908.⁷⁰⁸

THE TOBACCO TRUST.

The history of the international tobacco monopoly is very different from that of rails or soda. The struggle was much more intense, one might almost say more dramatic, and its result led to a far closer form of organisation, an international trust.

The rise of this Anglo-American Trust has been described from the English side by Mr. Macrosty, in its connection with the American Tobacco Trust by Mr. Jacobstein, and recently, in even greater detail, in an official American Report.⁷⁰⁹ It will be sufficient to quote their conclusions.

On the ground that the American trust, the American Tobacco Company, were

endeavouring to capture the English market by price cutting, the thirteen chief English firms united in 1901 to form a defence organisation called the Imperial Tobacco Company. This company had a capital of £11,957,022, and bought up several more firms in 1902. After a sharp struggle with Ogdens Limited and the British Tobacco Company, which had been bought and reorganised by the Americans, the Imperial Tobacco Company came to an agreement with the Trust. From 1902 on the company, now amalgamated with Ogdens, was left in undisputed possession in England,⁷¹⁰ while the Trust was given a similar immunity in the United States. A new third company, the British American Tobacco Co., conducted the export trade, the Imperial Co. holding one-third of the shares and nominating six directors, and the American Trust two-thirds of the shares and twelve directors. So far the object of this common undertaking has been to form branch trusts in the great import countries, Australia, Canada, and South Africa, possibly following herein the example of the American Trust, which formed a branch trust in 1902 in Cuba — the Havana Tobacco Co.⁷¹¹

The English tobacco monopoly is therefore organised as follows: The English combine has an unchallenged outlet for its goods in the United Kingdom, as the American Trust has in the States. In certain organised foreign markets mutual competition is further prevented by their common representation, the British American Tobacco Company. The possibility that this division of markets might be rendered nugatory by the intervention of a third party was foreseen in the agreement of 27th September 1902, and it was laid down in paragraph 18 that “None of the parties should sell any tobacco products to any person, firm or company, who they had reason to believe would export the same to the territory in which the sellers had agreed not to sell such goods, as herein provided.”

The following diagram furnished to me shows the organisation at a glance. I have added some figures:

American Tobacco Company (100,000,000\$ common and 80,000,000\$ preferred stock).

Imperial Tobacco Company Limited (capital, £15,496,154).

British American Tobacco Company (capital, £6,100,000).

The British Tobacco Company Ltd. (Australia) £4,500,000.

The Imperial Tobacco Company of Canada, \$11,000,000.

The United Tobacco Companies Ltd. (S. Africa) £800,000.

By the formation of this combine the English tobacco manufacturers gained the exclusion of the greatest, and in many articles the only, foreign competitor. The peculiarities of the English consumption of tobacco and tobacco products had for years made America the chief source from which leaf tobacco was imported. While Germany, during the period 1895–1905 drew the majority of its import from the East Indies, Brazil, and Cuba, and only about 17 per cent, of the total from the States, England drew 83 per cent, of its tobacco leaves from North America. As tobacco manufacturing extended and became cheaper in America, the export of certain manufactures to England naturally increased continually. In 1902 it represented a value of \$1,403,482; in 1906, though the total American export showed no decrease, it had fallen to \$333,584.⁷¹² Clearer testimony to the effect to the mutual understanding could not be required.

Once more the decisive factor was that in both countries production was strongly concentrated. In the States the Trust controlled the following percentages:⁷¹³

	1891	1902
Cigarettes and Small Cigars,	88.9	82.8
Smoking, Chewing, and Snuff Tobacco,	7.1	70.2
Plug Tobacco,	2.7	71.2
Fine Cut Tobacco,	4.1	73.7
Cigars,	—	14.3

It will be seen that its position was very much stronger in 1902 than in 1891, when it dominated one branch only. It was this increased strength that enabled it on the one hand to attack the English market, and on the other hand to make a peaceful agreement with its rivals, which would have been inconceivable if American production had been split up among many undertakings.

In England a similar concentration had taken place, as the fact that in 1904 the Imperial Tobacco Company (which then included eighteen undertakings) represented half the total production,⁷¹⁴ shows. Of the purchase price of the thirteen firms amalgamated in 1902 in the company, £6,999,221, or more than half, was for the great firm of W. D. & H. O. Wills in Bristol. Some of the existing outsiders, such as

R. & J. Hill or Gallaher, are important firms, but, as the years following the formation of the combine showed, the outsiders also could only maintain themselves against the combine by means of amalgamation and the erection of greater business units⁷¹⁵ — a process which must in course of time lead to agreements between them and the combine, and even, perhaps, to a further expansion of the combine.

One cause of concentration in tobacco manufacturing has been the increased use in recent times of machines. “Wherever possible,” says the American report,⁷¹⁶ “machinery has been substituted for hand labour, and the greatest success of the combine has been in those lines of the industry where the greatest use of machinery is possible. In little cigar and domestic cigarette production, where almost all the processes are performed by machinery, the monopoly of the company was more readily established than in any other branch except snuff.” The monopoly was the least complete in cigar making, where hand labour is still extensive. The same thing undoubtedly influenced concentration in England, though the monopolist use of patents was not so prominent as in America.

A second reason lay in the fact that as the potential productivity of undertakings increased, the necessity of developing production on a large scale by every possible means also grew. Every big firm endeavoured by advertisement to obtain the wholesale consumption of its goods. The change has been described recently by Mr. Archer, a director of the large firm of Hill mentioned above, in the following words:⁷¹⁷ “When I was first in business some thirty-five years ago competition among tobacco manufacturers was almost entirely as to who could produce the best quality and the best value for money, and considerable experience and practical knowledge of the business were necessary for success. All this is completely changed, and now competition seems to have resolved itself into a question of who could afford to spend the most money on advertising.”

Both in buying new plant and in advertising the Imperial Company had, owing to its large capital resources, considerable advantages over the relatively small outsider. In addition the English combine has formed its own purchase company in Kentucky, the Imperial Tobacco Company of Kentucky, through which it bought raw materials more cheaply than through middlemen.⁷¹⁸ The American Trust and the various foreign Régie agents have exercised considerable influence on the prices of raw tobacco in virtue of their position as buyers *en gros*,⁷¹⁹ and the English combine has now also begun to offer planters relatively more favourable terms than the small

separate firms.

Quite recently the company's advantageous position compared with outsiders has been further improved by the formation of planters' associations in America. In West Kentucky and Tennessee the planters of black tobacco, for which England is the chief market, have united, and the Burley tobacco planters in Kentucky and Ohio have followed suit.⁷²⁰ This is probably the first time that monopoly has arisen in agriculture, and it has only been carried through by the "nightriders" by means of the extreme forms of compulsion, even at times including assault and battery on recalcitrants.⁷²¹ Whatever the means employed, there certainly followed an exceptional rise in raw tobacco prices, which the American Trust had tried to keep down. Good Burley tobacco which in October 1902 cost only \$7.50–8.40 per 100 lbs. rose in the autumn of 1907 to \$10–12.⁷²² Such a state of affairs was far more favourable to the English and American combines which had no reason for mutual competition than to the outsiders. Monopoly was faced by monopoly, not by single firms. In fact, latterly it has looked as if the combines by taking over the greater part of the planters' association's crop intended to make difficulties for competitors in the advanced stages of manufacture.⁷²³ In spite of their original purpose of defence against the large buyers, the planters' association will probably come to a lasting agreement with the combines and Régie agents, by which the latter's position against outsiders would certainly be greatly strengthened.

Not much can be said of the policy of the English combine with regard to prices. Though its influence must undoubtedly have been considerable, its exact weight is obscured by the difficult question of the raw tobacco supply. At a recent meeting the chairman of the company took the rather surprising ground that its policy had to some extent been the salvation of the outsiders. "The company," he maintained, "had shown a liberal spirit and a desire to put up prices, so that other people could not say that it was bearing down rates and forcing sales at prices which were in some cases simply ruinous."⁷²⁴ This attribution of excessive virtue to the combine seems a little unconvincing, especially as it represents the reply of the chairman to a possible attack which he apparently felt difficult to meet.

The preservation of an undisputed internal market by means of international agreement opens up a new possibility for monopolies in England. It is the newest of all causes which aid in the formation of cartels and trusts, and the last which we shall need to describe in detail here. We have tried so far merely to set out clearly the

conditions under which large industrial monopolies can nowadays arise in England, and for this purpose we have taken the history of the most important and most lasting syndicates, cartels and trusts as our guide. No attempt has been made to describe associations whose monopolist character is as yet but slightly developed or whose persistence may still be open to doubt; for we were not concerned to give a detailed and exhaustive picture of all combines past and present, but rather to extract from a consideration of the chief instances some conception of the circumstances which at the present day, after so many years of unadulterated competition, fix the limits within which monopolist organisations are possible in English industries.

Before the results of this examination can be summarised, one further question remains. The financial success of a monopolist organisation depends primarily, but not solely, on a more or less definite control over production. The fact that by co-ordination or amalgamation production can be monopolised does not in itself show how the new association will profit by the advantages of its situation. Its structure and detailed equipment — its form, its administration, the number, relations, and capacity of its directors, the division of output and sales between the various members, and the financial position — are here all important. Two problems of organisation have been especially important in the history of English combines, central administration and a sound financial basis. On both points something must be said.

Chapter X. Questions of Organisation.

All the types of monopolist organisation known to the experience of other countries are to be found among the chief English monopolies. We see every stage of monopolisation, from loose understandings terminable at any moment or the more definite agreement for a fixed period, to the yet closer unions of the syndicate with a common place of sale and common regulation of production and the amalgamation into one undertaking of all the firms in favour of monopoly; that undertaking in its turn perhaps forming new syndicates and cartels with important outsiders. Each variety is distinguished from its predecessor in order of completeness by the greater number of functions formerly exercised by separate firms which it usurps and subjects to a common monopolist control, until, finally, in the “horizontal” combination, every single function is transferred to the trust.

The general experience in Germany has been that problems of organisation are more complicated in associations of independent makers than in amalgamations and trusts. Once private interests are sunk in a single undertaking, the difficulties of settling the form of administration seem to be nothing compared with those of the time in which the directors are continually faced with the thorny questions of division of production, consumption by a member of the association, common places of sale, and so on. In England, too, in former times, the Newcastle Vend, which was an association pure and simple, was much more complicated in organisation than any of the monopolies of modern times.

But at the present it is not the cartels and syndicates which prove in England the most difficult to organise, but the trusts. In Germany combinations are usually composed of a large number of undertakings gradually amalgamating into a trust; in England they have, as a rule, only a few members. As many examples have shown us, the possibility of raising prices by monopoly is much smaller than in countries in which natural monopolies in raw material, protective duties or high freights on competing goods, make such a policy especially attractive. It is, therefore, relatively difficult to unite the 30, 40, or 50 interested parties in a combine; much more difficult in any case than where the probable monopoly profits of each are so high as to overshadow completely any objections which might be raised to the surrender of all

independence. Accordingly, it has been found imperative in England to form a trust where, as in textiles, salt, soda, and Portland cement, many undertakings were affected. On the other hand, where there was only a very small number of firms, and private interests opposed to association were slight, monopoly has been achieved by a mere association in spite of the fact that the prospective profits were small. In the steel trade, especially in ship plates, boiler plates, and rails, in industrial spirit, and in cables, monopolies have been firmly established by such means.

As these syndicates and cartels only include a small number of members, usually of about equal power, their organisation offers far fewer difficulties than on the continent, where cartels embrace works both "simple" and "mixed," and of unequal economic and financial stature. But the organisation of English trusts, which have in several cases involved the amalgamation of a great number of firms, each working under different conditions, has often proved to be very much more complicated, for instance in the textile industry.

In this case every single firm had to be allowed a large measure of independence as a branch of the trust. The English Sewing Cotton Company left each member its own individuality. Every partner or director of a former firm remained responsible for his own branch in addition to becoming a director of the whole trust. The organisation was in every way the opposite to the highly centralised firm of Coats, and its initial failure to rival the success of the latter was not least of all due to this division of powers. It was not until the company was reorganised with the help of Mr. Philippi of Coats's, and provided with central management and a common place of sale for all works, that an end was put to the evil system by which each separate firm went its own way without a thought for the interests of the whole. It was the same with the Manchester Bleachers. According to the prospectus, each firm was to deal personally with their own customers, direct their own works, and even receive a percentage of the profits. But the most loosely knit of all textile trusts was the Calico Association. It had a directing body responsible to the shareholders of 70–80 persons, 128 "vendors" of the 46 firms forming the combine each retaining the right to run their works for five years independently of the managing directors, and, finally, a number of managing directors. Although the association represented a financial amalgamation, in its inner constitution it resembled a badly organised cartel far more than a uniformly constructed trust.

Defenders of the theory that English manufacturers are by nature individualists

might perhaps claim this scrupulous retention of individual functions even after the formation of a trust as a further proof of their thesis. But this interpretation of the case is hardly justifiable. The peculiar organisation of the textile associations is explained by the simple fact that certain firms enjoyed a special repute which it was not desired to destroy; and accordingly their outward form was preserved, certain persons cognisant of the special wishes of customers were secured for the trust, and, no doubt to encourage sales, manufacturers were often assured a special share in the profits of their former works in the form of percentages. The decentralisation merely meant that the amalgamating firms possessed advantages for the sale of their special products which they did not wish to surrender, and which the trust did not wish to lose.

Economic advantages, therefore, sufficiently explain the form of organisation which the textile associations first adopted. Experience was necessary to prove that the immediate attractions of decentralised management were overshadowed by its drawbacks, and that important gains expected from the combination of undertakings could not be realised under this system. Economies in directors' fees, the allocation of production to the most efficient, and of orders to the most favourably situated as regards freights, the limitation of output in times of over- production, and the other advantages of combination, could only be effected if the trust was centrally managed. Accordingly, after a few years, the textile monopolies were reconstituted. The Bleachers altered their articles of agreement in 1904, the Calico Printers, though not apparently with finality, and the Sewing Cotton Trust, in 1902.

We have already seen that while the movement towards concentration may well have in all cases an innate tendency to monopoly, inasmuch as monopoly may arise at very different stages of concentration and combination, we must carefully distinguish two separate series of events. The continual expansion of single works and firms may lead to concentration and to monopolist organisation, without that process culminating in a permanent trust. This is what we find going on to-day in the great development of concentration in the textile monopolist associations since their re-organisation. Their annual reports are full of the "policy of concentration." The English Sewing Cotton Company's Report of the 25th July, 1907, for instance, enumerates the following results of "concentration."⁷²⁵

1. A linen thread mill was sold to round off the trust's sphere of business. 2. The production of the Egerton Mill was transferred, the report explaining that the trust "

had sufficient reserve productive capacity at other mills to enable them to deal with the trade conducted at that branch.” 3. The plant of the Belgrave Mill at Oldham was removed, and the site and buildings sold. 4. Finally, “a further concentration took place by the transfer of the business of R. F. & J. Alexander & Co., carried on at Duke Street, Glasgow, to one of the other branches of that company.” A special account of such transactions was kept (Closed Works Account). Contemporaneously with this policy of concentration output was centralised by the connection of the Sewing Cotton Co. with Messrs. Coats, and the system of common sales established in 1906 through the Central Thread Agency. The net profits of the company have since greatly increased, though, for the most part, this is due to the improved market. The net trading profit, which had been £170,829 in 1904, and only £92,614 in 1905, rose to £254,846 in 1907, and was maintained in 1908 with a falling market at £251,938.⁷²⁶

In the Calico Trust the question of reform dragged on for years. We have already mentioned the first change in 1902. According to Mr. Macrosty, this made the whole business more prosperous,⁷²⁷ but recently an even more centralised organisation has proved necessary. The main advantage of the reorganisation in 1902 was the consolidation of the board of directors, which was reduced to twelve or fifteen persons. But the report proposing the reform explained that to entrust the management to these directors alone would exclude⁷²⁸ “a large number of men of ability and ripe experience, possessing an intimate knowledge of all the important matters upon which the Board would have to decide,” to the great detriment of the association. Accordingly, beside the board, an executive committee was set up, besides various “advisory committees” of suitable persons, who, without being independent of the directors and the executive committee, were to assist them in special questions of production, markets, and their organisation. These committees had each their special province — factory output, designs and styles, concentration, prices, retail, purchase of stuffs, chemicals, coal, etc. The report of 1902 shows very clearly the efforts that were made to reduce the former number of independent persons connected with the direction of the association and to centralise the management in the hands of a few directors. But it also shows that, whether because “men of experience” had to be kept or because a division of labour was really necessary in an industry with so many branches, the structure of the undertaking was still pretty complicated. Except so far as resolutions affecting the general constitution

and management of the association went to modify matters, there remained a division between the functions of the directors and executive on the one hand and the owners of the individual mills on the other. In fact the very division was expected to strengthen the directors' impartiality. "The directors and executive having to protect the interest of the Association as a whole, it is undesirable that they should be connected with the management of any particular branch or section, as their opinions might be influenced thereby." It was also thought impossible to break with the system by which each owner shared in the profits of his own mill. Percentages were indeed abolished, but the report explained that "a system of payment by results" would be introduced in some other way. The main change, therefore, was the reduction in the number of directors, which made it easier to arrive at decisions on general questions, and the creation of advisory committees which, to some extent, served to focus the main common interests of the individual mills. On the other hand, each firm retained its own customers and its own market, and kept the management of its business pretty fairly in a water-tight compartment.

In 1908, however, the association produced very unsatisfactory financial results, and another attempt was made at closer centralisation.⁷²⁹ Since 1908⁷³⁰ the chairman of the directors had been a man who had had a large share in the organisation of Coats & Co., who had reformed the Sewing Cotton Company, and who had been chairman of the advisory committee during the reorganisation of the Calico Association in 1902, Mr. O. E. Philippi. As in America, so in England, a new type has arisen, the "Trust Organiser," whose personal knowledge of organisation in all its forms and shapes makes him indispensable in every emergency. Since Mr. Philippi's accession to the Calico Association the idea of completely concentrating the control of production and sales in a single central body as in the other textile associations seems to have carried the day against the desire of retaining for each firm its own individuality.

The well informed Manchester Guardian stated at the end of February 1909, that "the system of branch trading" has produced generally unsatisfactory results. "Under the old system of working it was not possible for the head office to obtain a sufficiently intimate knowledge and control over the work of the branches, and in spite of all the checks that could be devised there has admittedly been much internal competition, overlapping, and waste of energy and expenditure." In future there was to be a central authority for all mills, controlling the entire production and all sales,

and the separation between the management of individual mills and the board of directors concerned solely with the general administration of the association was to cease. Output would be divided among the mills from a single central point, marked by the sole office of the association, a special division of the central office dealing with the supplying of each particular market. This result would be a great advance on the centralisation of the trust's organisation, and its realisation may be awaited with great interest.

At the same time the revised constitution of 1902 has led to some considerable efforts at concentration. "With fewer works and fewer machines than we employed at first, we have printed [in 1907] a greater number of pieces and we have provided these at a greater rate per machine per hour."⁷³¹ Other signs of concentration were seen in 1906,⁷³² in the purchase of Northrop machines, 20–24 of which could be worked by one operative,⁷³³ in the closing of inferior mills and the sale of mills no longer worked, and finally in the buying up of various outsiders.

Where, as in the Calico Association, comparatively numerous separate works have to be amalgamated, concentration in organisation is naturally a slower process than where only a few large concerns have to be fused together;⁷³⁴ yet in such cases it is all the more necessary and often the surest preventative of over-capitalisation, an infirmity to which the large industrial undertakings of modern times are particularly liable.

We have already pointed out that the formation of a trust can come and has, in fact, come in England at several quite different stages of concentration. If the trust arises whilst the competition of numerous less efficient concerns still exists it to some extent anticipates natural development. Manufacturers hope to avoid the ultimate result of the movement towards concentration, and, without fighting the competitive struggle to the death, to enjoy the advantages of the surviving fittest. In other words to limit the total production of all existing firms to a few working at much lower cost owing to technical expansion, economies, and so on, and to fix prices on a monopolist basis by the suppression of many competitors. If competition is unrestricted, this consummation is achieved by the gradual extinction at a heavy capital loss of the less efficient firms; but if a trust is formed these firms are bought out at prices depending on the trust's expectations of profit from the new business. Supposing those expectations are not fulfilled, the combine has an ever-increasing dead weight of over-capitalisation round its neck and its entire financial success is

endangered.

The Calico Association appears to be an instance in point,⁷³⁵ owing largely to the failure of its organisation to save as much by concentration as was expected when the shares were allotted. Another instance is the Portland Cement Association, the ordinary shares of which had, according to the 'Economist' in 1908, never paid a dividend.⁷³⁶ Apparently in this case the poor financial results were due to the importation of cheap natural cement, which prevented the trust from realising the prices of which its founders had dreamt. In a third instance, that of the Salt Trust, both these two factors combined to produce over-capitalisation. The trust overestimated its monopoly, and was painfully awakened to the truth by new competition and falling prices; and when at the end of the nineties it had come to an understanding with the outsiders, serious deficiencies in organisation again appeared, inasmuch as the Salt Union guaranteed each outsider joining the cartel a certain output, and suffered accordingly in times of short demand. Possibly this arrangement was the only means of salvation open to the trust, which in 1898 and 1899 paid no dividends either on ordinary or preference shares. For five years it at least paid preference dividends. But in 1905 and 1906 difficulties began once more. Net profits again did not suffice for a dividend. The North-Western Salt Company was founded to help the union by including in one association all the interested parties, without imposing such onerous conditions on the union. After a ten years' pause, the ordinary shares paid a dividend in 1907 and the preference shares one of $8\frac{2}{3}$ per cent, the largest since the union started in 1889.

The causes of over-capitalisation are numerous. Anticipated increase in price proves impossible. New competitors arise, foreign or domestic. New processes of manufacture are discovered — a potent factor in the poor financial success of the Alkali Company. Organisation is bad. But all of them come to this; that whether because it is harder to monopolise output and sales than was expected, or because the monopoly is not so energetically used as it should be, the rosy views taken of the prospects when a combine is started are not in practice realised. It is the story of the older monopolies once more. They too suffered from over-capitalisation and their founders also, the "projectors" as they were then called, to gain the grant of a monopoly and its protection by duties and by prohibition of import took upon themselves financial responsibilities which they could not discharge, and which finally destroyed them and their projects. As Mr. Price says of Mansell's glass

monopoly,⁷³⁷ “a large proportion of this [capital] was water, for at least three patents were bought up which would have possessed no value if markets had been open to all. And Mansell had bought out his own partners upon the basis of the speculative value of monopoly.” Monopoly making is always a speculation; but the more irredeemable capital liabilities have been piled up, the greater will be the discrepancy between the original capital basis of an industrial monopoly and its actual results in the gloomy days of continued ill-success.

Very many English combines have not, of course, met with these financial difficulties. In textiles, for instance, Coats & Co., the Fine Cotton Spinners’ and Doublers’ Association, and the Bradford Dyers’ Association prove what financial successes monopolist associations can be. The Dyers’ prospectus in 1908 stated that in every year from 1900 to 1907 “the net amount available after payment of the debenture stock interest has been more than twice the amount required to meet the dividend on the preference shares, and the profit-earning capacity of the Association has steadily increased.” Similar success has crowned the efforts of the Tobacco Trust, and the American Trust has no reason to regret its financial partnership with the Imperial Co.⁷³⁸ After paying debenture interest at 4½ per cent, 5½ per cent, on cumulative preference shares, and 6 per cent, on preferred ordinary shares, the combine could still lavish on the unpreferred shares remaining 4 per cent, in 1903, 6 per cent, in 1904, 8 per cent, in 1905, 10 per cent, in 1906, and 12 per cent, in 1907 and 1908. It must, however, be remembered, in judging such prosperous results, that the English combine was an amalgamation of only thirteen firms, of the first rank and of great size. It included no small and financially feeble outsiders, bought up solely to prevent competition. And it was in consequence spared the disappointment openly expressed at a meeting of an over-capitalised textile combination in 1901 which drew from a director the following comment: “Some seemed to object that certain small firms had been bought, but in forming a big association like that they were bound to a large extent to take the bad with the good.”⁷³⁹ Here we see once more the danger already alluded to which a combine runs when it buys up at high prices businesses which would undoubtedly collapse within a visible time under the stress of competition. Under such conditions the attempt to precipitate by a trust the monopoly which must in the natural course result from the slow but steady concentration of plant and business frequently leads to a financial fiasco. The position is different if the monopoly is organised at a stage in the movement towards concentration at which

only a few very efficient undertakings survive.

It appears, therefore, that the monopolies resulting from the combination of a few very powerful firms are also the most successful financially. One of the most flourishing monopolist associations, for instance, in English industries is the Whisky Trust, in which a single firm engineered concentration for several decades, not by buying up inefficient competitors, but by entering into partnership with the strong survivors of a very bitter competitive struggle. The history of Coats & Co. is similar. If they had from the beginning bought up weak outsiders, they might well have suffered the disadvantages of over-capitalisation, which, in fact, appeared in the amalgamation of those same outsiders into the English Sewing Cotton Co.

It would also seem that large separate firms associated only in a cartel are more likely to pay their way in such cases and increase their profits than a trust including under the same financial control a greater number of firms of an inferior though productive type. No doubt an over-capitalised trust may be able gradually to close inferior works bought up at a heavy cost in favour of the better works, but this retards that increase of productive power by the reduction of working expenses, which is the more desirable for a trust, because the cheapening of production is one of its main defences against the rise of smaller undertakings, and goes to secure its monopoly.

Chapter XI. Theoretical Conclusions and Criticisms.

The basis of English cartels and trusts is in every case concentration, the restriction of increasing production to an ever decreasing number of factories and undertakings. Add to concentration immunity from foreign competition, and all that is essential for the creation of monopolist associations is given. To explain the real importance of concentration in connection with English monopolies, it is only necessary to contrast the conditions which characteristically precede monopoly in Germany, America, and other countries with those in England. Concentration has been at work abroad too; but while in England the movement towards monopoly only begins when the number of producers has shrunk to 40, 30, 20, or even less, foreign monopolies have often been formed at a much more elementary stage of concentration, and in some cases even when both production and the number of producers were increasing. What is the explanation?

We have considered two lines of enquiry bearing on the possibility of industrial monopoly. We asked under what circumstances could English manufacturers maintain a monopoly in their home market against foreigners, and we asked under what circumstances could they suppress domestic competition. We must now examine the results of these enquiries.

1. As to immunity from foreign competition.

England is much more exposed to foreign competition than are protectionist countries of considerable size like Germany and America in most of their industries. She has no protective tariff, the protection she derives from freights is comparatively insignificant, and she produces relatively few minerals enjoying natural monopolies in her own or the world's market. The only exceptions in the last case are coal, stone, and salt; and while a monopoly in salt has actually proved possible, internal competition has so far made it impossible in the other two. As a whole, therefore, the three factors which in other countries, where cartels and trusts arise, appear as the essential conditions of most industrial monopolies, are unimportant in England.

Where immunity from foreign competition exists, it is due in the first place to the fact that many English industries are for various reasons able to give the home consumer cheaper or better goods than the foreigner can. This may be the result of

natural advantages, such as climatic conditions, etc., in the case of textiles, or of tradition and training as in tin plates, in which the inherited skill of generations of operatives is important, or finally, in many recent cases, as we have seen in various branches of industries, because England has turned more and more to the production of higher grade goods, and thereby secured a predominance over other countries. But wherever it is the case, wherever English manufacturers can offer home or foreign buyers cheaper goods or better qualities than any other countries can, they can also by combination utilise their monopoly either to force up home prices to the level of import prices or, in the case of goods in which there is no immediate fear of competition, to fix prices “autonomously,” that is to say without paying any special attention to foreign sellers.

In the second place, immunity may be due to international cartels and trusts, though here again England’s position is different to that of the other contracting parties. Being protected from foreign competition by tariffs or freights, the main advantage to them of an international association lies in the creation of an undisputed foreign market. To English manufacturers, on the other hand, the chief gain, to which the reservation of a foreign outlet is only secondary, is in the closing of the home market to the foreigner.

In most cases, therefore, the facts which give industries immunity from foreign competition in England are different from those which do so in Germany or America. And the difference is of far-reaching importance.

(a) Industries which enjoy a monopoly at home owing to tariff protection, or which are situated in places remote from foreign export centres, can usually increase prices very largely if competition is suppressed. The difference between the price of English and German pig-iron in Ruhrort, allowing for duty and freight, is 21–22 marks per ton;⁷⁴⁰ in Pittsburg it is 7 dollars or about 28 marks.⁷⁴¹ At times this difference has amounted to 33 per cent, of the price in Germany and America. In high grade manufactures the protective effect of freights is generally less, but those of tariffs increase. In 1902 the duty in America increased the price of tin plates over the Welsh price by \$1.28 on a commodity the average price of which for the year in New York was \$3.94 per 100 lbs. Moreover, it is clear that in times of over-production, when there is competition among the home makers, prices even in protectionist countries can sink beneath the world’s price. For instance, pig-iron was 2 or 3 dollars cheaper in Pittsburg in 1897 and 1898 than in England. When this happens, a monopolist

combination can raise prices in good times by even more than the amount of the duty and freight. In 1902 Pittsburg pig-iron prices were \$10 higher than in 1897.

But in England in industries which, with prices at a certain level, can escape regular foreign competition, the difference between the import price and the minimum amount to which home competition can depress the home price is nothing like so great. No doubt, in theory, as Prof. Liefmann says,⁷⁴² prices can in England also sink "far below the limits" within which an import trade is possible. But where this is not due to the special quality of English goods, or to special natural or acquired advantages in production, it is only true of industries which can produce more cheaply than abroad, and in which the foreign manufacturer, protected by a tariff and aided by a cartel, is satisfied with small profits on his export trade; so that when the world's demand is small the difference between the home competitive price and the import price is not very great. When the world's demand rises and the competition of protectionist exporting countries diminishes, the gap of course increases. But as Dietzel was the first to point out,⁷⁴³ the difference in price between times of great and slight demand is generally much greater in protectionist than in free trade countries, and accordingly even when import prices rise the English monopolist cannot increase prices to the degree which his protected compeer can.

(b) There remains the case of commodities in which a monopolist increase in price is not dependent on this difference between the import price and the low English competitive price. Where England has natural or historic advantages for production or a world wide reputation owing to the manufacture of special qualities, no immediate question arises. Importation would only begin to limit the monopoly price when home prices were quite exorbitant. Long before this point is reached another fact, the possibility of finding a market, commences to exercise a moderating influence. Now English monopolist organisations differ from those of Germany and America in that they are primarily concerned with high grade manufactures, and they have to reckon with quite different effects on demand of increased prices to those which result in raw materials and half manufactured goods. In most countries, bodies like the German potash cartel, the Chilian nitrate cartel, the American petroleum, borax, and copper trusts, and the monopolist combinations in raw zinc, which on their own merits, quite apart from tariffs or freights, entirely control the home market, are all connected with the production of minerals. Provided persons interested in such branches of production combine, a considerable increase on the

existing competitive price is usually possible without provoking any appreciable decrease in demand. The maintenance of the rise of course depends on whether fresh competition can spring up, and under certain circumstances the increase is only possible in the early days of a monopoly. But the tendency of cartels and trusts largely to increase prices without troubling as to any possible fall in demand can be clearly seen in certain monopolies of raw or only slightly manufactured materials.

The minute investigations of the American Trust Department show that the Standard Oil Company in fixing their prices, considered the possibility of competition only and that the idea of causing a disastrous fall in demand by enormously high prices in undisputed areas never entered their heads. "The evidence is absolutely conclusive that it is the policy of the Standard Oil Company to take full advantage of competitive conditions to impose the highest prices possible. Having a monopoly at home, it has charged such prices as it could thereby extort, and the American consumer has to pay these prices."⁷⁴⁴ In December, 1904, the same oil cost in Delaware 7.7 cents per gallon, and in Colorado, where the expense of refining and selling could not have been more than about 3.5 cents greater, 16.2 cents, carriage being in both cases excluded. The company had no competition to face, and profited thereby to increase its price by nearly 100 per cent.⁷⁴⁵ Yale tells us⁷⁴⁶ that "independently of any price" the consumption of borax in America is constant. The Borax Trust accordingly directs its policy solely towards not stimulating outsiders by its excessive prices to work mines hitherto regarded as worthless. When the German thorium nitrate manufacturers had monopolised the Brazilian monacite beds, they combined to raise the price of saltpetre from 34 marks per kilo in 1902 to not less than 53 marks in 1904.⁷⁴⁷ The German potash cartels, in spite of their continually increasing membership, maintained the price of 80 per cent, chloride of potash, which sank in 1878 to 9.2 marks, at a yearly average of 14.25 marks from 1896 to 1906.⁷⁴⁸ And if we turn to England, we find that the Salt Union on its formation in 1888 forced up the price of ordinary salt from 2s. 6d. to 10s. 6d. a ton,⁷⁴⁹ and might well have maintained this price for a considerable period without affecting demand had it not provoked fresh competition and over-production.

The Salt Union was, however, an exception. It is the only English industrial monopoly resting on the natural scarcity of a mineral product, and producing a raw material the consumption of which would only fall if prices were very high. The vast majority of English industries which are protected from foreign competition by

economic advantages manufacture high grade goods and articles of exceptional excellence or specialities. Every increase of price in such cases is at the risk of a fall in demand, followed by the increasing consumption of similar goods of poorer quality. This is especially true in textiles, — one of the chief industries organised on a monopolist system — the most important of whose seventeen monopolist combinations we have passed in review. In 1907 the whole English textile trade — especially the high grade lines — was faced with the unpleasant fact that while raw materials rose, a corresponding increase in the price of manufactured goods was impossible if sales were to continue undiminished.⁷⁵⁰ The Report of the Sewing Cotton Co. stated⁷⁵¹ that they “aimed always at holding our trade, and to do this prices to the consumer could not be put up in proportion to the abnormal prices secured by the spinners during the last year.” It is, of course, questionable whether monopolist influence on prices did not have its effect even without such “proportional” increase, but the possibility of demand falling was clearly considered. In other commodities the danger is that higher prices will drive consumers to inferior but cheaper articles. Both the Portland cement trust and the cable cartel have had clear evidence of this; and probably other monopolist combinations have had similar disappointments which have not been generally known in public.⁷⁵² The experience of countries which have more trusts and cartels than England bears out the view that an advantageous increase in price is far more difficult to effect in finishing trades than in raw materials and half manufactured goods, and that “a small market and a high price” is a far less lucrative policy in the former than in the latter, in which the repressive force of rising prices on the demand is relatively small.⁷⁵³

To sum up the relation of foreign competition to English industrial monopoly. In England there is no protective tariff, freights from abroad are insignificant, and minerals which can be easily monopolised and which command a monopoly in the home market are very few. Hence the formation of a monopoly is far less generally possible than in Germany or America. Within a small sphere there is no doubt more or less complete immunity from foreign competition; but even if home competition can also be suppressed or restricted, the raising of prices by monopoly is more limited in range, and therefore generally less profitable in results than in countries of tariffs, high freights and mineral monopolies. This circumstance reacts of course on the factors which settle whether or not it is possible to suppress home competition.

2. From Adam Smith onwards political economists have pointed out that the fewer

the competitors, the easier it is for them to combine. The observation is correct; but it does not at first sight explain why in two industries in which the conditions favouring the monopolisation of production are otherwise the same the numbers combining are very different; why, for instance, in one trade 100 persons can form a cartel, while in another 50 cannot see their way to share the chances of monopoly. The secret lies in the ratio of existing competition to the advantage to be attained. The greater the advantage of combination, the earlier a large number of competing firms will agree to give up their various private interests for the sake of what they can only achieve by united action, or the sooner a trust maker will resolve to buy up all rivals even at prices which many of the separate undertakings would never fetch in the ordinary market. Per contra the smaller the advantage to be derived by each from a cartel, the smaller the monopoly profit to the trust maker, and the more necessary if there is to be a monopolist organisation at all that the number of undertakings in the combine be small. A cartel or trust formed of a very few undertakings may offer only a relatively small increase in profit compared with a larger operation. On the other hand it offers the great advantage that only a few persons need decide on partnership or on the sale of their works. The actual suppression of home competition turns therefore on the number of manufacturers and the anticipated monopoly advantages accruing from combination.⁷⁵⁴ The estimate formed of this advantage by the competing firms or the trust maker, as the case may be, depends on the answer to two questions: What can under favourable circumstances be the monopoly profit, supposing competition to be restricted to suit existing conditions? and Can this monopoly profit be maintained in the future, without risk of its decreasing through the rise of fresh competition?

(a) That in industries protected by high tariffs or freights or based on a natural monopoly of raw materials a large number of undertakings can under certain circumstances unite in one organisation has been frequently proved in the history of monopoly. The clearest example is the German sugar industry.⁷⁵⁵ The German sugar cartel of 1900 ('Deutsches Zuckersyndicat' and 'Syndicat der deutschen Zuckerraffinerien') embraced no fewer than 450 refineries, differing very greatly not only in situation, size and plant, but also in their connection with agriculture, in their organisation, and so on. All divergencies were, however, sunk in the general desire to take advantage of the chance of profit offered to a monopoly by the customs and financial policy of the empire and not to waste it by domestic competition. The

combine was accordingly formed. The moment, however, these advantages disappeared or diminished through the abolition of export bounties and the reduction of the customs duty under the Brussels Sugar Convention, the cartel collapsed. In Russia 171 out of the existing 215 refineries formed a similar syndicate in 1887 to raise by means of import duties and export bounties the prices which over-production had depressed.⁷⁵⁶ Similar motives united an equally considerable number of firms in the Spirit Ring; and the 96 members of the first coal syndicate in Rhenish Westphalia in 1893 were induced to abandon competition in order to profit from the protection given by inland freights by adopting a system of allotted districts.⁷⁵⁷ When the syndicate was renewed in 1903, 100 independent collieries announced their adhesion.⁷⁵⁸ The protected stoneware trade, represented by about 100 firms on the Saar, the Rhine and in Lorraine, founded in 1899 the Association of German Stoneware Manufacturers (*Vereinigung deutscher Steingutfabriken*) which covered about 97 per cent, of the total output, and straightway carried out a 10 per cent, rise in prices.⁷⁵⁹ The Union of German Wire Nail Makers (*Verband deutscher Drahtstift-fabrikanten*) had 81 members at the time of the *Kartellenquête* and controlled about 90 per cent, of the output.⁷⁶⁰ In America between 1870 and 1872 there were 200 competing petroleum refineries. Enormous profits were to be made if such industry with its worldwide predominance could legally, or if need be illegally, be formed into a monopoly by obtaining possession of a large number of refineries and oil wells. The possibilities overshadowed the difficulties of buying up so many interests, and according to a recent calculation the American petroleum trust has acquired not less than 215 undertakings since 1870.⁷⁶¹ In American tobacco it was partly the position of the trade in the world's markets and partly the high duties on cigars which made a trust so attractive. Between 1890 and 1904 the founders of the trust acquired 180 undertakings,⁷⁶² more than half of them between 1899 and 1903, after M'Kinley had reintroduced the high rates which the Wilson tariff had somewhat reduced. The Pittsburg Coal Co., the great bituminous coal trust of Pennsylvania, was the result of an amalgamation of 140 competing firms which exploited the monopolist position of the district.⁷⁶³ We may add to these instances one: which we have ourselves had cause to investigate at first hand, the old Newcastle Vend with 76 to 128 members between 1835 and 1844. As we saw, the union of this large number of competitors in a cartel was due to their hope of exploiting the high protection given them in the southern markets by the cost of

freights. As soon as this protection diminished, most of the members left the combine.

The possibility of increasing profits by monopolist association is, as we have shown, much smaller in England than in Germany or America. And the importance of the present-day concentration of plant and business interests lies in the degree in which the steady decrease in the number of competing firms encourages combination to exploit even small monopoly advantages. Almost without exception English cartels and trusts have arisen in industries to a certain degree free from foreign competition and considerably concentrated; while the smaller the profit to be derived from monopoly the greater the necessity of few competing firms. In the steel trade, which was at one time very much threatened by foreign competition, the decrease in competitors had to be very extensive to make a monopoly conceivable, but at the present time when in each district only a dozen firms at most survive it is a familiar phenomenon. With textiles it is the opposite. Monopoly in some cases is the result of the association of thirty to fifty firms, a large number for an English combine. But textiles were far less subject than heavy steel goods to foreign competition, and accordingly the difficulties of uniting so many interests were outweighed by the great advantages promised by a monopoly. One apparent anomaly should be noticed. The greatest number of undertakings ever included in the original scheme of an English monopoly was the sixty-four firms of the Salt Union in 1888. Unlike all the other English cartels and trusts which we have considered, the union exploited mineral deposits possessing within a very high price limit a monopoly in the home market against foreign producers, and producing a necessary article of general consumption. What was hopeless in coal was realised in salt. A coal trust, though likely to gain large profits from a monopoly, is made impossible by the numerous districts between which the total production is divided, and the exceptionally large number of independent collieries. Salt is practically concentrated in a single county, and in the hands of far fewer makers. But the Salt Union is in this an exception, and an exception proving the general rule. Though in other countries monopolist combinations may, in certain circumstances, be formed out of an imposing array of independent undertakings, in England, under the conditions of production and distribution which have prevailed for the last thirty years, the advantages of monopoly can only be exploited by a cartel or trust when the number of competing undertakings is small, usually not more than a dozen or so.

(b) The degree of advantage does not, however, depend on the immediately existing number of competitors — which may obviously not remain unchanged. Every industrial monopoly must from the beginning face the problem whether its enhanced prices may not call fresh competition into existence, and the answer to this question in its turn depends very largely on the immediate prospects offered by the trust or cartel. If they are good, if, for instance, a heavy customs duty can be exploited, founders will elect to make hay while the sun shines and trouble little about the impending danger of competition. But if even the initial chance of profit is small, the probable immediate rise of competition, if profits increase, will much diminish the readiness of manufacturers to combine. The advantages to be gained, in themselves small, are hardly worth fighting for if they are but temporary. No doubt the seventy odd makers of tin plates in S. Wales could come to an understanding which would produce a certain rise in English and international prices. But as it would be comparatively easy to start new tin-plate foundries, the capital cost being small, the permanence of the rise would clearly be doubtful, and there is little inducement to form a monopoly. In England, where the chances of monopoly profit are in any case slight, the question, how long competition can be suppressed is specially important for the would-be monopolist. What are the factors on which his decision rests?

In the first place, the way in which fresh competition will develop. Most foreign cartels and trusts are either directly based on the monopolisation of raw materials or indirectly control the raw materials they require. Fresh competition in opposition to such monopolies must usually produce at higher cost than the combine; for if the monopolists control the districts which produce raw material cheaply, are favourably situated for markets and so on, new competitors must either buy what is left over, the monopoly not being complete, at higher prices fixed according to the profits of the combine; or develop dearer and less accessible supplies of raw material; or if they are engaged in the further manufacture of monopolised raw materials, buy them in the market instead of producing them themselves. In such cases production is only possible where the conditions are less favourable, so long as the monopoly price offers a safe return even to firms working at heavy cost, and so long as the more favoured undertakings, or in the case of a trust, undertaking, make a surplus profit. I have tried elsewhere to describe the actual working of this process in the typical case of the American iron industry in 1905.⁷⁶⁴ As was there shown the United States Steel Corporation found an increasing number of outsiders springing up in various

branches of its activity. These produced at a higher cost than the corporation owing to the comprehensive monopoly of raw materials and the impossibility for various reasons of a vertical combination, and apart from the over-capitalisation of the trust were economically in a less favourable position. In the production of pig-iron for steel outsiders only competed so far as to possess furnaces which worked when demand was high and were put out when prices were low, as, unlike the trust and the large "mixed" concerns, they could throw away no profits. They were in fact, as Prof. Liefmann justly says, reserve factories. Such outsiders are not loved by combines; but as they produce at higher cost, they are not formidable. They are always in danger of making a loss at prices which yet pay the combine, and of being forced either to close down or to submit to the monopolists. In such cases, therefore, the monopoly has some degree of future security.

But where increased monopoly prices will call forth other undertakings which can buy their raw materials at the same price as the monopolists, and can produce as cheaply, the position is very different. In certain circumstances which we shall shortly see, if existing firms form a monopoly and raise prices, they merely stimulate the foundation of new concerns which can depress prices again to the basis obtaining originally without thereby gaining less or losing more than the monopolists. The latter have accordingly to reckon on the rise of fresh competition capable not only of existing so long as it shares the monopoly profits, but also while in competition with the monopolists of keeping its profits low, it may be lower even than those of the separate firms before combination. It was on the existence of such conditions that the classical economists based their doctrine of the equalisation of profits. If they, in fact, always governed industrial monopolies, monopoly could not at the present time exist in England, for as we have seen, monopolised raw materials are practically non-existent. They are at any rate unknown in almost all the monopolist organisations which we have considered. The textile trusts, the steel combinations, the whisky and industrial spirit makers, the cable cartel, the wall paper trust, and the other monopolies may all have to face outsiders who — with certain exceptions and apart from the natural fluctuations of the market — can obtain raw materials and other necessities for production at the same prices as the combines, and can work them up in their factories at approximately the same cost. Even in the case of minerals like salt and cement, the natural supplies are so great that neither the Salt Union nor the Cement Association ever attempted to monopolise them. Yet all these cartels and

trusts, and others not here discussed, started with the well-founded expectation of permanently suppressing competition or at least maintain their existing “incomplete” monopolies.

A few years ago an authority on American economic conditions, Dr. Vogelstein, expressed the view⁷⁶⁵ that “inelastic capital resources are the point at which monopoly, pure and simple, and a preponderatingly monopolist economic system with legal freedom of trade meet.... The possible monopoly of cartels and trusts rests almost entirely on the natural scarcity and inelasticity of an element of production.” Whether this generalisation can be legitimately drawn from the position of American trusts is, as we shall see, doubtful, though most of them certainly fulfil the condition laid down. For England, the theory is certainly incorrect. The question of a natural or artificial inelasticity of supply is here quite unimportant, special cases excepted. In England it is the size and productive power of an undertaking which produces a tendency to monopoly. The large capital investments which concentration encourages make the foundation of competing firms increasingly costly and difficult. Further, and this is perhaps the more important fact, every new competitor fit to keep pace with the gigantic creations of concentration means such a very large increase in production that to find a market there must either be an enormous increase in demand or an immediate drop in prices to a level unprofitable to both the new firm and the monopolists.

The moment the increase in the productive power of an economically profitable business outstrips the growth of the demand, the tendency among existing undertakings to form a monopoly is checked. This has very often occurred in England where concentration of industrial units, horizontal and even vertical combination have of recent years immensely increased the capital resources and productive power of individual undertakings. To compete with firms representing 10, 20, or more per cent, of the entire output under conditions of production and distribution as favourable as those which their enormous organisation gives them, requires a certainty of finding a profitable market for a correspondingly large output. Assuming that the necessary materials can be acquired at the same cost, any one who can raise sufficient capital can set up an opposition firm producing at approximately the same cost. But if demand rises slowly he is digging his own grave. If a combination of these enormous concerns has further resulted in a trust or cartel, the demands on the fresh competitor become even more excessive. Even with a monopoly, attempts at

greater efficiency persist, and sometimes the very size of the combination, witness the case of the Calico Printers or of Lord Furness's project, helps to decrease working expenses by better organisation of production and distribution. Naturally a new competitor need not by any means be prepared to equal the combine in productive power, for very possibly some of the combined firms are not of an economically profitable size. But it must at least be of the same productive power as the firm working most cheaply, and that alone implies a very great size where an industry is highly concentrated.⁷⁶⁶ And if the advantages of combination have reduced the average cost of production to the combine to a level below that at which the cheapest producing firm can work in isolation, the new competitor must produce on a large enough scale to try conclusions on this basis. He must make his undertaking larger than the biggest of these combined in the monopoly, and thereby add to the risk of not being able to find a market for the increased output.

Let us take a hypothetical case.

Case I. — Assume an output of x goods per firm, the actual cost of making being £7. Assume further a selling price, if there is only one producing firm, of £31, and that every additional x reduces it by £2. With twelve firms, therefore, the price is £9, and the addition of a thirteenth firm will drive the price down to the unprofitable level of £7. Accordingly, twelve firms, producing $(12 \times x)$ goods, and selling at £9 would be the largest number that could exist, assuming that no further competition could arise unless it were possible to sell at a profit. But now let us assume these twelve firms organise a monopoly, and, by reducing output, force up the price to £11. At once a new firm can spring up, and without hurting itself reduce the price to £9 again by its additional output. The attempted monopoly has failed; in fact, if the original twelve firms again put their full output on the market, there will be overproduction and a general fall of prices to below the cost of manufacture. The attempt to form a monopoly would therefore be ill advised.

Case II. — Let us now, however, assume that concentration produces an amalgamation of each group of four firms, each unit, owing to increased efficiency, producing $(4 \times x)$ goods at £24 instead of £28 ($4 \times £7$). On this basis a new comer will have to produce $(4 \times x)$ goods and will in consequence depress prices even more than before. If, instead of reducing the price by competition to £9 for x goods, the three new groups formed out of the former twelve firms now combine, a new firm will not pay till prices reach £15 for x goods. At any lower rate the additional output

would drive prices down too low for there to be any profit. At £15 the new supply would produce a reduction to £7 for x goods, and make a profit of £4, the cost of manufacturing ($4 \times x$) goods being £24. The unit of manufacture being increased, the monopolist combination could merrily drive up prices to £13, provided it kept in mind the danger of fresh competition, and that competition was governed solely by abstract reasoning.

The actual degree to which the monopoly would be worked depends, of course, on the amount of output which produces the largest total profit. In case II. the combine producing at £72 (£24 \times 3) would rather sell ($10 \times x$) goods at £13 per x goods, than ($12 \times x$) at £9, or ($11 \times x$) at £11, and would regulate its output and price policy accordingly. Suppose now, demand increased. In principle the position is unchanged. In case I, with twelve separate firms, if, instead of ($12 \times x$) goods ($13 \times x$) goods could be sold at £9, a new firm would spring up. In case II the monopolists would primarily profit by the increase in demand to sell their otherwise unproduced (or possibly dumped) 11th or 12th x goods at £13, and no fresh competition would arise. But if demand continued to increase till a 13th x also could be sold at £13, a new firm would pay, as its additional output of ($4 \times x$) goods would only reduce the price to £7. So strong a demand would therefore reduce the limit up to which monopoly, with due regard for security from competition, could raise prices. An understanding with the outsider would, of course, again enlarge the monopolist's range.⁷⁶⁷

It must be remembered that we are only dealing with a tendency, and a tendency not often realised, if only because the founder of a new undertaking does not always know in advance what its influence on prices will be, or will not recognise it until mutual competition degenerates into economic suicide. At the same time not only the theorist but the student of actual industrial history will find the recognition of this tendency instructive. We have seen that the formation of monopoly depends largely on the number of existing manufacturers, and now we see why it did not result earlier, even where that was small. It is not the absolute number of competing firms which is decisive, but rather how far they could maintain a monopoly if they combined. If a relatively small concern is economically profitable, so that a slight increase in demand or price gives a new competitor a fair chance of existence, existing makers cannot maintain a monopoly even if they can obtain it. A monopoly is only conceivable when concentration has steadily increased each single concern's share in the total output. Whether the innate tendency of every such concentration to

lead to monopoly actually develops to the extent that the permanent existence of a cartel or trust is possible, depends on the degree of concentration and the nature of the demand. Organisation to exploit its advantages is only attractive if existing undertakings are so large that for many years it will be unprofitable to set up a fresh undertaking in spite of an anticipated increase in demand.

In the desire to emphasise the protective effect of concentration, other factors which have in England worked in the same direction have for the minute been neglected. It is necessary, therefore, to recall the fact that the trust and cartel movement has often arisen in industries in which concentration was by no means the only security for a permanent monopoly. In the salt industry, though monopoly, it is true, first appears with the expansion of private undertakings resulting from the acquisition of transport and the consequential concentration, yet there was still a relatively large number of rival works in existence and the increased monopoly price at once stimulated further competition. In this rather exceptional case the possible profits of monopoly were great, and the question of their permanence was therefore of only secondary importance. Nor must it be forgotten that in a few cases, even in England, inelastic supplies of the requisites for production — for instance water-power in that of the Bleachers' Association — can check competition. The Bleachers' Association included more firms (53 in all) than any other of the textile monopolies, and showed therefore a much smaller degree of concentration than was necessary for most English trusts and cartels. Finally, the reputation of an established firm, with its own accustomed makes and regular clientele, or the inherited skill of a special class of operatives, form in certain circumstances an element in a monopoly which must not be undervalued. Firms enjoying such advantages can sometimes, even if the protection of concentration is still insignificant, form a combine without fear of immediate competition. But the protection of a tradition is immeasurably smaller than that of inelastic material resources, which makes it hopeless *ab initio* for a competitor to obtain what he requires for the purposes of manufacture at the same price as his antagonist. When the supply of such things, which exercises so much influence on the erection of monopolies in Germany and America, is so little limited as in England, the essential protection from fresh competition must lie in concentration, though naturally even in England subsidiary inducements can accelerate the day on which concentration will actually result in the formation of a monopoly.

It remains to draw a few conclusions. The development of cartels and trusts in English industries is restricted within narrow limits by three facts, the absence of a protective tariff, the comparative insignificance of freights, and the rarity of slowly reproduced mineral products likely to form national or international monopolies. Manufacturers can only set about the monopolist organisation of an industry when it is free from foreign competition, owing to the lowness of the cost of production, to the manufacture of special qualities, to traditional dexterity, or to international agreement. Even in such cases, monopoly is subject to certain conditions. On the one hand the profit is relatively small, compared with what it is in countries which are not without the three features mentioned above; and on the other hand the industries affected are such that their materials can be acquired at equal or even less cost by others, whereas many of the most important monopolies abroad are in industries whose materials cannot be multiplied at will, and can be monopolised. Therefore, even where prices could be raised so far as foreign competition is concerned, a successful monopoly can only be established when, in the first place, the number of competing firms is relatively very small; and in the second place, when the rise of fresh competition, even if prices are good, is either out of the question or only to be expected after a considerable period. Both conditions can only arise under the existing industrial organisation after concentration — in other words, when the number of undertakings decrease while production increases, and the most satisfactory economic unit can satisfy to an increasing degree the total demand for a given class of commodities. Concentration of works and undertakings is the foundation stone of English cartels and trusts. The conditions which made monopoly possible in other countries, even where concentration was but slightly, if at all, developed, being wanting in England, until the recent growth of concentration it was inconceivable. England presents the curious contradiction that, in the days when cartels were unknown in Germany or America, she had quite a modern cartel in her coal trade, based on freight advantages. When the rest of the world was being satiated with cartels and trusts, free trade, the improvement of transit — a very important factor in so small a country — the transition to the preponderating production of manufactured goods from imported raw materials and similar causes kept her from monopoly. The change came gradually after about 1870, in many trades even later, with the growing tendency of industrial capitalists to concentrate production in a few undertakings. For those who wish to study the effect on monopoly of that

concentration by itself, all other influences being excluded, England now offers the ideal field of inquiry. There alone it is seen over a whole economic area, with nothing to obscure its working.

The same tendency must doubtless be counted among the chief factors of monopolisation in other countries also. But numerous examples show that in those countries monopolies were conceivable owing to other conditions, even without concentration, or arose at a comparatively early stage in its development. And further, given strong concentrating tendencies, their influence is hidden by the 'existence of other conditions of monopoly. For instance, the fact that a Bessemer Steel Rail Works in America requires an annual output of 400,000 to 600,000 tons to pay, and that existing concerns had as early as 1903 a theoretical productive power of over 3,000,000 tons, must certainly dissuade people from starting new works. They would need to be confident of finding a market for the additional output of the new works not only during a boom but in average years, while in fact in years of depression the consumption of iron rails often fell far below 3,000,000 tons (1903, 2,100,000 tons; 1908, 1,350,000 only!). This state of affairs must, of course, have aided existing concerns to maintain a monopoly, but its effect in actual fact was almost entirely overshadowed by another factor, the monopolist control of the iron ore deposits, which gives existing undertakings a power that practically precludes the rise of new Bessemer Steel Works, even if such a thing were in itself profitable.

In other countries commercial policy, transport facilities, the chance existence of slowly reproducible minerals forming a national or even world-wide monopolies, and other similar factors not essentially connected with the natural development of modern industrial capitalism can cause monopoly. Its rise under such conditions is not peculiar to a certain advanced stage of capitalism. Like the early cartels in English coal and copper mining, and so many German cartels and American trusts, such monopolies may be short-lived phenomena vanishing with the disappearance of some accidental or temporary condition. In England, on the contrary, the creation of monopoly is directly connected with the most modern development of industrial capitalism, and is its logical consequence. The recent rise of cartels and trusts must therefore be regarded as essentially the pure result of that economic law which we have called the movement towards concentration.

There is no reason why the recently invented international cartels should not produce the necessary conditions for monopoly in England just as well as in other

countries, inasmuch as international agreements have the same practical effect as a protective tariff. But up till the present time, as we have found, they have only appeared where concentration was already in a highly advanced stage.

In dealing with the sphere of free competition we traced the possibilities of concentration in England, its rapid progress in some industries, its complete non-existence in many, and the probable continuance of that state of affairs in the near future. We have seen, too, that owing to the absence of those artificial aids which stimulated it in other countries, concentration developed comparatively late in England, and that English industry as a whole by no means represents the most advanced type of combination now in existence.

Very different would the picture be if England broke with the free trade system. Protection would increase the number of trades in which the creation of monopoly would depend solely and singly on the amount of home competition. A great many industries in which at present concentration has very largely reduced the number of firms, but in which foreign competition has so far prevented a monopolist combination, would, under a tariff, straightway be in a position to found cartels or trusts. As it is, many industries threatened by foreign competition now find it easier than it used to be to suppress home competition; and in proportion as this is so, the probability that protection would be the last thing requisite for a monopoly increases. In any case, the prospects of monopoly building in such industries would be much brighter than in the days when the main problem was to suppress domestic rivals. For this reason, free trade is much more important as a defence against monopoly than it used to be. Moreover, duties on half-manufactured goods and raw materials stimulate vertical combination, and so artificially hasten the tendency to concentration. Finally, a tariff would, as in other countries, encourage the monopolistic combination of far more firms than is now possible, because the attraction of monopoly would grow with the possibility of profiting by the protective duty, and therefore monopolies would be conceivable in England even where little or no concentration had taken place. British tariff reformers are so well aware of this connection that they often desire a protective tariff simply as means to creating trusts which they consider to be the most advantageous form of industrial organisation — a view strongly criticised on economic grounds by Prof. von Schulze Gavernitz.⁷⁶⁸ Whether sound or not, this project has no great influence on the practical development of English economic policy. It is true that some struggling English

industries look upon a trust protected by a tariff as the remedy for dumping by foreign cartels and trusts, but the great bulk of the people, warned of the effect of trusts on prices by the experience of other countries, display no sympathy with such schemes, and the argument that trusts and cartels should be “encouraged” by protective duties will never carry weight with the English masses. Free traders no less than tariff reformers value the advantages of combination as a matter of organisation; but they maintain that under free trade alone can monopolist organisations produce desirable economic results. This opinion finds support among English, German, and American economists alike. It rests on the argument that under free trade a monopolist combination cannot aim at raising prices, which must sooner or later provoke foreign competition, but only at reducing expenses, and thereby increasing profits. The facts which we have considered, however, show that foreign competition may be neglected in considering English industrial monopolies entirely in some cases, and in the rest up to a certain degree. The aim of such combinations is, at least in part, nothing more nor less than to profit more by freedom from foreign competition than would be possible if home competition continued unchecked.⁷⁶⁹ Just because they result from concentration it is an undoubted characteristic of English cartels and trusts that by economies and better organisation they produce especially large reductions in the working expenses of an undertaking. In many cases this may have been the chief object of the founders of great combines. But that does not alter the fact that even such combines, if free from foreign competition and strongly entrenched at home, occupy a monopolist position, which no one prevents them from using. As we have seen, this commanding position is not so strong, especially in the matter of prices, and its profits are not so great as in countries with high tariffs or heavy freights or natural monopolies in minerals. But we have also seen from examples that it may have effects not in principle different from those of trusts and cartels in other countries.

It is admittedly a matter of very great difficulty to estimate the effects of English cartels and trusts on prices. In protected countries import price plus freight and duty are the measure of monopoly price, and it has been proved that in certain circumstances a trust or cartel has succeeded in raising the former competitive price by the whole amount of the duty. But in England prices often stand below the import price in spite of a monopoly rise, or, again, they develop quite independently of foreign prices and themselves fix the price in foreign markets, in which case no

measure of the prices of English monopolists can be gathered from a comparison with foreign prices; while the absence of accounts of expenses makes it impossible to compare prices and costs before and after the rise of monopoly. The history of various cartels and trusts points, however, to the following tendencies.

In the first place, the fixing of prices exclusively by competition is in general superseded by a more or less entire autonomy of the monopolist combinations, even where there is no complete monopoly. The decisive factor in prices in the particular industry affected is the price of the cartel or trust, whose power is no doubt definitely limited, but whose influence on prices is large and systematic. We find it almost universally stated in the reports of trade papers and similar documents that monopolist combinations “raised,” or “reduced,” or “tried to maintain” prices. In other words, prices no longer depend merely on the results of unrestricted competition.

In the second place, monopolist combinations usually achieve their avowed aim of raising prices above competitive prices. For this purpose cartels (for instance, the Spirit Cartel and the Salt Union) generally adopt the well-known device of assigning to each member a given quota of the authorised output; looser combinations rely on agreements to limit production, more particularly when demand falls. The object is often greater steadiness of prices, but the result is also a higher level of prices than competition would have allowed.

Finally, monopolist combinations show their influence in the division of markets so characteristic of trusts and cartels in other countries. In the steel trade we find not only a division of markets by nations within which there is a fixed normal price, but also systematically reduced prices for export. Such “dumping” is always possible where an English monopolist combination sells its products in distant markets, and therefore, as in the case of the Salt Trust, is protected from reimportation by high freights. And the history of the Bradford Dyers shows how even that combination tried to maintain different prices for certain classes of goods in different places according to the strength of its position.

Such a policy in prices, which is very different from what prevails under competition, can only be undertaken by monopolist combinations. Nearly all of them have announced in their prospectuses that “price cutting” would be abolished. Very often they guaranteed not to use their monopolist position in developing prices, or, as the Dyers’ Trust expressed it, not to “assume the role of monopolists.” The

industrial spirit cartel was represented to be “a quite innocent combination of manufacturers to prevent the depression of prices.” Similar assurances accompanied the foundation of every trust that announced its appearance openly. Even Lord Furness thought it necessary to explain in connection with his projected trust in 1908 that they were not aiming at an “artificial level of prices”; and Messrs. Coats once declared that they did not intend to get higher prices than those of the separate undertakings (of which they were in amalgamation), but that marked improvement in prices must naturally result where they had been unduly (sic) depressed by unfair and immoderate (sic) competition. Explanations of this kind make it obvious that it depends solely on the will of the monopolist combinations to put in practice a monopolist regulation of prices; and who is to guarantee the consumers that when a large monopoly’s founded, and perhaps over-capitalised, the possibilities of monopoly will be neglected, and that the interested parties will take advantage only of the cheapening of production resulting from the amalgamation? It is sufficient to read the following passage in the report of the Calico Printers’ Trust advocating a reorganisation after three years’ existence:

“The disadvantages referred to ... make themselves felt in most cases where a business is converted into a public company, and to a greater degree when a large number of businesses are combined and sold to the public. The necessity of meeting outside competition is no longer felt to the same extent, and the incentive to work the business economically in order to obtain an adequate return on the capital employed is seriously lessened. Too much reliance is placed on the possibility of obtaining higher prices, whereas it is in the case of a public company of the greatest importance to supervise every item of expenditure.” Unfortunately it is not often that a trust is driven to such admissions about itself. It can only happen when, owing to even monopolist prices not giving the desired return, efforts must be made to increase profits by reducing working expenses.

Mr. Macrosty’s contention that the higher prices obtained by English trusts and cartels can only be attacked if it can be proved that competition prices are healthy prices seems to me open to criticism. It depends entirely on what “healthy prices” as an economic term is to mean. Apart from practical impossibilities there is little to be gained theoretically by the calculation of the excess of prices over cost of manufacture to which he pins his faith. Very often we have to deal with a monopoly which has intervened in a slow process of concentration which would ultimately end

in the survival of the fittest, for the very purpose of saving from sudden extinction firms which can no longer face the prices produced by competition. In such a case higher prices would be justified on the basis of normal profits by the higher cost of production compared with more favoured works. But whether the continued existence of such firms is economically desirable is no more settled than whether a nation should or should not preserve its decaying industries by protective duties.

On this ground alone — and others might be added — it seems to me that a general verdict on the economic effect of the actual prices obtained by English monopolist organisations is impossible, though there is no doubt of their monopolist trend. And to my mind its main importance lies rather in the methods adopted than in the actual level of prices reached.

For the first time since the earliest days of capitalism a large section of English trade has become overrun with monopolist organisations. What in those days rested on legal privilege, is now, though trade is free, the natural result of economic and more particularly capitalistic development. The analogy is not complete, for the monopoly of the present day is not full fledged, but rather competition reduced to semi-monopoly. Yet it is true to say that at a higher stage of development capitalism has returned to the form of organisation peculiar to its infancy, with closely similar results. In the seventeenth century the privileged entrepreneur, the “monopolist,” regulated prices “at his pleasure.” Now it is the cartel or trust which so far as it can “fixes” prices in large areas on monopolist lines. Separate rates rule in separate markets according to the degree of monopoly obtained, just as in the seventeenth century the monopolists fixed district prices for salt. As in the sixteenth and seventeenth centuries the grant of monopolies artificially increased the power of certain capitalists and forced capital to concentrate by uniting in the hands of a single person or company the few existing capitalist concerns, so now cartels and trusts outstrip concentration, and attempt to obtain at once the monopolist advantages to which concentration would ultimately in the natural course lead. Undertakings spring up financially dependent on the speculative value of anticipated monopoly profits, and as hazardous as the old monopolies for whose patents courtiers had paid too heavily. Again we are faced with the question, Does the consumer or finishing manufacturer actually benefit by the reduction of cost promised when the monopoly is started, or is it true, as Davies said in 1641, that “the interests of the subject and the settled price decreed by the Patentee cannot consist”? The revival of these

long-forgotten problems marks the ebbing of the age of competition whose everlasting continuation no man doubted for a whole century, and the beginning for a second time of an age of industrial monopoly.

It is strange that not only the man in the street but the majority of politically and economically educated Englishmen are so slow to recognise this development. For nothing is more unpopular in England than any kind of monopoly. Neither the German consumers of syndicated coal nor the American victims of the Beef Trust showed half the fury of the peaceable English citizen when told that Mr. Lever wished to form a soap monopoly. The actual project was not a monopoly at all; but a few half-penny papers represented it to be so, and the British consumer, believing what he was told, supported the retailers so manfully that the Lever scheme had to be abandoned. Clearly a temporary outbreak of the anti-monopolist conscience whose origin we have already traced to the anti-monopoly agitation of Stuart times.

Generally speaking Englishmen believe in what may be called the “natural” necessity of competition. The teaching of the classical economists is in their blood. Not that individualism kept manufacturers from coalition! As we have seen, they were ready enough for monopoly where there was a prospect of monopoly profit. But concrete possibilities of monopoly were till lately very rare, and the conservative mind of the Briton not interested as a manufacturer or consumer remained incredulous. Even so excellent an economist as the present editor of the ‘Economist’ still holds that high profits must call forth fresh competition, and cannot reconcile himself in his book to a belief in the permanency of English monopolist associations. In 1849 John Stuart Mill, with only a few examples before him, wrote of businesses “carried on upon so large a scale as to render the liberty of competition almost illusory,”⁷⁰ but Mr. Hirst, for all his great knowledge of modern industrial conditions, still refuses to recognise that the very size of modern concentrations may to some extent give them a monopolist position.

On the other hand, the effects of trusts and cartels in England have not been so marked as to provoke popular opposition, and in consequence they have aroused little political discussion. In 1908 Sir G. Parker asked in Parliament whether a committee of enquiry was not desirable, and was informed by the Prime Minister that he was aware of the existence of such combinations, and that in some cases their effect might be prejudicial to the public, but that he was not at present prepared to grant an enquiry. It was no accident that the question came from a conservative tariff

reformer. It was hoped by pointing to the existence in England of powerful monopolist combinations “in spite of Free Trade” to destroy a claim which had hitherto contributed not a little to the popularity of that doctrine. The present majority in Parliament and the Government⁷⁷¹ do not seem to be inclined to raise such questions, and many Liberal members connected with cartels and trusts may well derive some personal comfort from the negative attitude of their party. There have been no official or Parliamentary reports on English cartels and trusts. In America the Government have caused detailed enquiry to be made into the Tobacco Trust and its policy, but no such light has been turned on to the British Tobacco Trust — which is practically the same concern — or on any other monopolist combination. This may be because of the narrow limits within which monopoly can regulate prices in England as compared with America or Germany. But whatever the explanation the result is that the standpoint which regards all these cases as manifestations of the same tendency to organise on monopolist lines is only slowly gaining ground.

The nation which was the first to abolish by a great outburst of energy the restrictions set on the development of free competition in industry still believes that it has won that freedom for all time. It will, therefore, perhaps be some time before it too becomes convinced that in large spheres of industrial production a change in organisation is dawning which will offer new economic problems both to the student and the statesman.

Appendix I.

A. Cartel Agreement of 1835.

(‘Report of the Select Committee on the State of the Coal Trade.’ House of Commons, 2nd August, 1836, pp. 7–9.)

It was handed in, and was as follows: Articles of agreement made this day of 1st 35, between the several persons whose names are subscribed, being owners or lessees of certain collieries within the counties of Northumberland and Durham.

1st. The owners or lessees of each of the undermentioned collieries, will by a written document appoint a representative, with full powers to act for such colliery, and to bind the owner or owners during the continuance of this agreement.

2d. That the representative shall have such an acquaintance with the general management of the concerns, and the money transactions of the colliery he represents, as to be able at all times to state correctly the quantity of coals sold, and the price actually received for the chaldron or ton, of both round coals and small, and shall be responsible for any irregular allowance or other deduction from the price at which his coals ought to be sold, or for any other violation of either the letter or spirit of this agreement.

3d. That the owners or lessees shall have the power of changing their representative, upon giving notice in writing to the chairman.

4th. That a committee for the Tyne, consisting of nine members (selected from the representatives), shall be appointed by lists to be sent from each colliery, to act for one year, subject to re-election at the expiration of every 12 months; but though it is desirable that the committee should consist of the number above stated, for the purpose of settling the basis for the respective ports and collieries, the committee shall nevertheless be competent to form among themselves a sub or execute one for the purpose of carrying the provisions of this agreement into effect, so that such committee shall not consist of less than three for the Tyne.

5th. That five constitute a quorum, that the votes be taken by ballot, and that the decision of the majority shall bind the parties to this agreement in all cases, except where an appeal is allowed.

6th. That the parties to this agreement will adopt the existing basis; for the collieries, whose quantities are now fixed, till such quantity shall have been objected to by the committee or the representatives, and finally settled by the referees, and in settling the quantity to be allowed to any colliery, the committee or referees to be guided by the powers of working and leading proportion of the different sorts of coal, their respective selling prices and facilities of shipment. But that in estimating the powers of the respective collieries for the purpose of fixing the basis, such portions of their respective powers as are applied to the producing of coals sold, foreign or land-sale, shall not be taken into the account.

7th. That impartial reference shall continue to be the great leading principle on which the arrangements of the trade must be governed, and that it must be applied to settle the quantities between the different ports or rivers, forming parties to this agreement, as well as between individual collieries.

8th. That before an appeal be entertained from a river or district, a majority of the representatives of the collieries of such rivers or district must have declared their conviction of the propriety of it, and have made such request in writing to the united committee.

9th. That the dissatisfied river or district shall name their referee, and that the united committee shall do the same, and that those two gentlemen shall name a third as umpire, previous to their entering upon the inquiry.

10th. That the whole expense shall be equally divided between the appealing part and the trade at large.

11th. That the referees shall have power to reduce or to augment the quantity of such appealing river or district, and such decision shall be final.

12th. That the above principles which are to guide the reference in the case of rivers or districts, shall be applied to individual collieries appealing from the decision of the respective committees in the district to which they belong, except that it shall not be necessary for any individual colliery to obtain leave of the committee of the river to which it belongs, to make an appeal from their decision.

13th. That as soon as this agreement shall be signed, the rivers and districts shall be at liberty to appeal to the present united committee, but in case no appeal is made previous to the commencement of 1836, that then no change of basis as between the rivers or districts shall take place, except at the commencement of each year, and then only in case the river or district shall have given four months' notice to the then

existing united committee of their intention to make such appeal.

14th. That in the case of individual collieries, they shall be at liberty to appeal also as soon as the agreement shall have been signed; but in case no appeal is made previous to the commencement of 1836, then no change of basis shall be made except at the termination of any six months, and then only on the representative of such colliery giving three months' notice previous to the 1st day of January and the 1st day of July in any year to the respective committees of his intention to make such appeal.

15th. That the decision of the referees shall take effect in the case of rivers or districts from the commencement of the year, in the case of individual collieries from the commencement of the six months succeeding the period when he shall have given such notice.

16th. That the committee or referees shall have power to summon the parties to this agreement, or their agents, to answer any interrogatories, and to produce any documents necessary to enable them to give full effect to this agreement, but such power not to justify calling for the private accounts of the colliery.

17th. That the parties so summoned shall, for non-attendance or refusal to answer or produce such documents, forfeit £20, to be returned only in cases where an appeal to a general meeting of representatives the majority shall decide in favour of the party appealing, the committee at such meeting not to vote upon the appeal against their decision; the votes at such meeting to be taken by ballot.

18th. That the relative prices of every description of coal be fixed by the committee and the representatives of each colliery, subject to an appeal to referees.

19th. That no colliery, without leave of the committee, shall vary the fixed price agreed on between such colliery and the committee, as the selling price of that colliery, under a penalty of 53. for every chaldron so sold, subject to an appeal to referees in case of dispute.

20th. The committee in concert with the committee of the Wear and Tees, and the other parties to this agreement, shall make such issues of round coal from time to time, as may be necessary to meet the demand.

21st. Any colliery where particular difficulties of shipment may be reasonably apprehended at particular seasons of the year, or other causes, may be allowed such quantity, from time to time, in anticipation thereof, as the committee shall deem proper; any colliery thinking itself aggrieved by the refusal of such leave, the claim

to be decided by reference.

22d. All coal to be sold by weight, either by the ton of 20 cwt. or the chaldron of 53 cwt.; any colliery found by the inspector giving over-weight to be fined 2s. 6d. for each and every cwt. of excess on an average of 10 waggons; every colliery to have a weighing machine, in proper order, in a convenient situation, under a penalty of £20.

23d. Any colliery exceeding the issue beyond 100 chaldrons, or 2 per cent, upon the basis, to finish a ship, shall forfeit for every chaldron so exceeding 53., and such excess shall also be deducted from the issue to the colliery for the next month.

24th. That each party shall deposit, in the hands of trustees, a promissory note, payable on demand, to the amount of £20 per 1,000 on its respective basis, as a security for the payment of fines and the general performance of this agreement, the committee to fix the amount of fines in every case not specially provided for; the trustees to consist of the chairman and the committee.

25th. That the inspectors of the Tyne, Wear and Tees, shall, as often as the committee of either river may deem it expedient, examine together the measure of all the collieries of the different ports comprehended under this agreement, that the weight per chaldron may be kept moderate and uniform, as provided in rule 22d.

26th. No freighting or upholding freights or prices to be permitted without permission from the committee of the river or district in which the respective collieries are situated under a penalty of 5s. per chaldron on the quantity of coals so vended, subject to reference.

27th. That all the parties to this agreement shall strictly adhere to such regulations as to the sale of coals in London by the coal-factors as the united committee shall, from time to time, agree upon.

28th. That if, at any time, during the continuance of this agreement, the united committees shall deem it expedient, for any temporary purpose, to grant an additional issue of coals to the markets upon the coast, they shall have power to do so under such modifications and upon such terms as they may consider expedient.

29th. That it be imperative on the committee to enforce the penalties incurred under this agreement, and collect the same once a month, and pay the same to the Newcastle secretary for the general purposes of the trade.

30th. This agreement to commence on the 30th day of January 1836, and to continue from year to year, during the pleasure of the parties hereto, any of whom

may withdraw, on giving six months' notice, in writing, to the united committee previous to the end of any year after the first year, and thus terminate this agreement.

31st. If circumstances should arise to render it expedient that this agreement should terminate otherwise than before provided for, and that, at a meeting of the representatives of the three rivers, and the other parties to this agreement, called for that purpose, four-fifths of the parties hereto shall so think it expedient, then this agreement shall terminate.

32d. No party to be bound by signing these rules until they shall have been agreed to and signed by the proprietors of every colliery upon the Tyne, and until the coal-owners of the Wear, Seaham, Tees, Hartley, Cowpen and Netherton, shall have signified their willingness to act in concert with the Tyne committee upon the general principles of this agreement.

33d. That in case any difference of opinion should arise between the respective committees, or any individual coalowner and the committee of the district to which he belongs, upon the construction of any of the above articles, or upon any other point not herein provided for, that the same shall be submitted to reference.

Appendix II

Combination of Works. Lord Furness's Speech.

(Report of the Eighth Annual Ordinary General Meeting of the Shareholders of Richardsons, Westgarth & Co. Ld. Held on Tuesday, 29th Dec. 1908).

The usual routine with regard to our annual meeting has this year been interfered with on account of a proposal which has been made to your Directors for the amalgamation of our business with those of several other engine building firms on this coast. I may at once say that I was in no way responsible for the proposal, and am neither directly nor indirectly interested in the scheme except as your chairman and as a shareholder in your Company, but the commercial possibilities of such an amalgamation are in the opinion of your Directors so important, that we feel it our duty, even at the sacrifice of very considerable time, to investigate the position thoroughly and to take part in what are proving to be very prolonged negotiations.

You will, I know, agree with me that the past year has been one of the most disastrous in the annals of the North-East Coast, involving as it did the practical stoppage of the engineering industry for no less than seven months by the engineers' strike, this in our own case being preceded by partial stoppage and complete disorganisation owing to sectional strikes in the shipyards. We have lost, in fact, an entire year, and the immense efforts we have made in laboriously building up additional branches to our business by the creation of new departments for the manufacture of steam turbines, pumping machinery, steel works' equipment and electric installations, have been ruthlessly upset by one of the most ill-advised and calamitous strikes on record. The general public have grown so accustomed to the continuous succession of strikes that nothing short of the stoppage of the nation's railway system or coal supply creates more than ordinary interest, but the alarming fact remains that British industries are being jeopardised and British capital destroyed to an extent unparalleled in British industrial history. Take our own case as an example. We have three works, in Hartlepool, Middlesbrough, and Sunderland, with staffs of highly trained technical experts for the conduct and development of our various manufactures, each department having an organisation of designers and

draughtsmen complete in itself. To supervise the actual manufacture there is a further organisation of works managers, departmental foremen and assistants, and in addition the usual commercial and clerical staffs, numbering in all some 250 men, whose services cannot, of course, be dispensed with the moment the general body of employé's decide to go out on strike. At the commencement of the strike it also happened that we had an unusual number of important contracts in process of erection in various parts of the kingdom, and at a stroke everything was brought to a complete stoppage, this being followed by the virtual paralysis of our entire business for seven weary months, each successive month bringing possibilities of settlement by various proposals, including the intervention of the Board of Trade, whose good offices were so flouted by the men as to result in the resignation of Mr. Barnes, the General Secretary of the Amalgamated Engineers' Society. For ourselves, we were compelled to see our profits turned into losses, grass actually growing in our yards, our customers disappointed and disgusted, and our prospective business brought to a dead standstill by reason of our inability to accept orders. In the town, as you know, men were brought to beggary, women and children to the verge of starvation, and tradesmen's savings reduced almost to vanishing point. This, then, is the sorry picture of a strike for which there was no justification whatever and which was blindly persisted in notwithstanding many friendly efforts, including those of a Cabinet Minister and the men's leaders.

We are still among the wreckage, but let us hope that this epidemic of strikes is over, for otherwise it will be quite impossible to maintain the prosperity which has hitherto been associated with the engineering industry on this coast. Indeed, even with a mutual desire to recover lost ground, it is problematical whether we can do so unless we adopt methods by which the cost of production can be reduced by the elimination of wastage. The position we have to face is one of intense competition, and what that competition means is well illustrated by the fact that our once highly remunerative forge department, together with many others in the district, is now practically closed, as we can obtain forgings at considerably lower prices than we can either produce them ourselves or buy them in this country. This competition will surely spread to other departments unless we adopt wise measures, and the points we must always keep prominently in view are — that there must be no strikes, that greater individual interest must be taken in the day's work, that contract dates must be kept and the confidence of buyers restored, and that the cost of production must

be reduced.

If commercial success is to be achieved by any scheme of amalgamation, however, it is obvious that it can only result from increasing the excellence of our manufactures and decreasing the cost of their production. Any attempt at artificially creating a range of selling prices higher than the market standard prevailing at any given time is foredoomed to failure, as we should deservedly lose our trade by sacrificing the goodwill of our friends and customers. The one objective must, therefore, be to beneficially influence the shipbuilding industry by supplying machinery at prices which will compare favourably with those of other competing centres, and at the same time secure, if possible, a fair manufacturing profit. It is unquestionable that marine engine building presents an ideal proposition for the application of such a scheme, and if it becomes an accomplished fact and is carried out with an enthusiastic determination to make it a great success, then, in my opinion, it cannot fail to have a favourable and permanent influence on the shipbuilding industry on this coast.

Experience has shown that the highest success in any manufacture can only be obtained by specialised production in large quantities under expert management. The production of marine machinery, and the mass of detail in particular connection therewith, involves so many trades each requiring a separate department, that specialised production in bulk under highly concentrated management becomes practically impossible for the average engine builder; but under an adequate scheme of amalgamation the entire proposition is simplified and is feasibly desirable. For example, the firms considering this scheme have, during the past seven years, supplied complete engine equipment to 1206 steam-ships, having an aggregate horse-power of 2,150,000. The detail alone in connection with the yearly output of 172 sets of machinery is enormous, and were it standardised and manufactured under modern conditions, profits would be obtained which, under the present conditions, are quite impossible.

In view of the highly progressive nature, not only of the manufacture of marine and other machinery but also of its design, every single builder is now constantly face to face with heavy expenditures for plant in order to keep pace with the times. Take another example: since this Company was formed, seven years ago, we have spent .£133,000 in new machinery and buildings, besides another ,£140,000 or thereabouts in maintaining our three works in a high state of efficiency, this expenditure being

entirely apart from the cost of our turbine works, which are practically independent and constitute what is to us an entirely new business, and which have involved an outlay of fully .£50,000. We are, of course, not alone in this expenditure, as all firms recognise that it is necessary for their very existence, and, heavy as it is now, it will undoubtedly become more so in the future by reason of the ever-increasing severity of competition throughout the industrial world. By amalgamating several of these big businesses, however, and localising, as far as practically possible, the manufacture of standard details, this enormous aggregate expenditure could either be very greatly reduced or, if spent as freely as at present, would inevitably result in far greater profit-earning capacity. This is to my mind the most important requirement of the present-day engineering manufacture. Experience has proved beyond question that in order to exist at all every engine manufacturer must, no matter how well his works may be equipped at present, continue to spend money very freely, and the essence of the contemplated scheme of amalgamation is to spend that money in such a manner as will enable a united body of manufacturers to meet competition with far greater success than is possible as independent units, each repeating the others' work in a fashion which, in years to come, will be regarded as tantamount to commercial suicide. The suggested amalgamation is therefore a commercial proposition of the first order, its anticipated effect being to conserve and ultimately to considerably enhance the value of the capital embarked in the industry, an effect which will apply equally to all the capital invested in engineering works on this coast. This is possible because an amalgamation offers facilities for the high development of an organisation on commercial, technical, and practical lines quite beyond those afforded by independent competitive units. Of course, any scheme of amalgamation decreases internal competition and automatic benefit would accrue under that head, but it would be a mere bye-product in comparison with the central aim and object, viz.: decreased cost of production. It would, of course, require time and immense energy on the part of everyone concerned to organise the new departure, but there would be compensation in the fact that the energy would be centred in the useful channel of progressive construction rather than in competitive destruction, and, therefore, it would beget that enthusiasm which is invariably associated with success.

It is a pertinent fact that all the firms on the coast buy many details in this country cheaper than they themselves can produce them, and yet the manufacturers of these details make very substantial profits. They do so, of course, by specialised production

and concentrated management. Again, we all make details which cost us just as much as we could buy them for, and we content ourselves with the thought that they contribute their quota to our working expenses. To obtain the profits we now lose, however, is only possible if the scheme of amalgamation is sufficiently large, so that unless all the firms at present interested in the matter are in agreement it cannot be carried through.

Under the present system engines and boilers are built by each of the firms to the requirements of the several classifications, and whilst the average result of each firm's productions closely approximates that obtained by the others, yet each builder has some points of excellence, either in design, method of manufacture, arrangement of parts, quality of material or of workmanship, which in combination would yield greater excellence, and being reflected in the higher general efficiency of the entire machinery, would tend to place British construction on a higher plane in the markets of the world. Again, each firm has an expensive staff, producing designs practically identical with those of its competitors, as well as pattern-shops producing equally identical patterns. The useless expenditure under these two heads alone may be estimated from the fact that the designs and patterns for a cargo boat's engines cost about £500 to produce, and for passenger steamers a correspondingly higher figure.

It is impossible for me to enumerate within the limits of a speech all the sources of economy that are open to such an amalgamation, but its possibilities are sufficiently indicated if you consider the matter on its broad lines. The adoption of a single scheme of buying under the control of the commercial directors would alone tend to a considerable diminution in first cost.

With regard to the works, one system of organisation would be established, all antiquated tools would be replaced, and the latest methods of manufacture adopted. Overtime, which is at all times highly expensive, would be abolished as far as manufacturing conditions permitted, and night-shift at high rates of pay only resorted to when it was warranted by the conditions of trade and obtainable prices — the productive capacity of the whole of the works acting in union would in all ordinary circumstances dispel the conditions which lead the individual to resort to overtime. Broadly, the leading principle would be to limit the working hours to the standard length of the working week and to divide the work amongst the various shops to that end — an arrangement, one would suppose, that would be as satisfactory to the workmen as it would undoubtedly be to the employers.

An important advantage to the shipbuilders would result from contract deliveries being strictly maintained, as in the event of local pressure relief could always be given by one or other of the amalgamated works. There would also be no reason why ships should not always be engined in the port in which they are built, as the same standard of workmanship would prevail in each of the amalgamated works. Last year the expenses incurred in this connection alone amounted approximately to £18,000 for insurance, towage, etc., all of which represents unnecessary cost, apart altogether from the loss involved by the delay in completion consequent on the ship's absence in a distant port for approximately a fortnight.

It is intended to retain the identity of the several firms as at present, and each firm would therefore trade under the name upon which its business has been built up, and by which its productions are known and celebrated the world over. Moreover, the local boards of management would continue and the executive staffs would be retained, as only by their united efforts could the new scheme of organisation be developed with despatch and success.

I would again emphasise the fact that I am simply putting before you the proposition which has been put before your Directors, and before all the firms interested in this matter, and it is only by force of circumstances and not by intention that it falls to my lot to give public expression to the views which prompted any of us to give the scheme our consideration. I am convinced, however, that if we are to advance our industries and protect the capital invested in them we must recognise facts and modernise our methods, and in dealing with this scheme we must also endeavour to sink personal considerations of every kind. We cannot but realise that the industrial world is advancing at a pace unparalleled in its history. To have been told ten years ago, or even five years ago, that Japan would be building, and building with the greatest success, her "Dreadnoughts," her fast torpedo boat destroyers, and her 23-knot passenger liners, would have been regarded as a dream, yet they are accomplished facts. Continental competition is also, as you know, increasing by leaps and bounds, but in spite of all I am convinced that we can hold our own, nay more than hold our own, if we will but shake off the incubus of our stereotyped industrial methods. In Germany, which is in the forefront of industrial progress, there are some hundreds of amalgamations of one kind and another, so there it has been amply demonstrated that the secret of commercial success lies in a policy of combined effort. At this stage I cannot say whether the scheme will mature or not; if it does it

will involve an adjustment of our capital to a basis which, it has been decided, shall be the standard basis for every firm, although on that point I am unable, and it is altogether unnecessary that I should say more on the present occasion. Your Board propose to you that this meeting shall stand adjourned until a convenient date, and that in the meantime you will patiently await the maturing of the negotiations that are now afoot, relying upon the ability and zeal of your Directors to safeguard and protect your interests in every possible way, and as soon as the negotiations are sufficiently advanced we will lose no time in putting the matter fully before you for your final decision.

Appendix III.

Organisation of Monopoly. The Industrial Spirit Cartel.
(Ridley's 'Wine and Spirit Trade Circular,' 8th Nov. 1907, pp. 828–9.)

THE INDUSTRIAL SPIRIT SUPPLY COMPANY, LIMITED.

Under the above title a "Trust" — as some people may be inclined to dub such an association nowadays — has been formed, through the hands of which will pass all the spirits sold for methylation or for use for industrial purposes, by the following firms:

ENGLAND.

London: J. & W. Nicholson & Co., Limited; Hammersmith Distillery Co., Limited (Haig & Co.).
Liverpool: Preston's Liverpool Distillery Co., Limited; A. Walker & Co., Vauxhall (now merged in the Distillers' Company, Limited). Bristol: Bristol Distilling Co., Limited.

SCOTLAND.

Bo'ness: Jas. Calder & Co., Limited.
Edinburgh: The Distillers' Company, Limited.

IRELAND.

Belfast: United Distilleries, Limited.

The only firm manufacturing spirits for industrial purposes which is absent from the above Combine as shareholders is that of Messrs. King, Howman & Co., Limited, Derby; but an arrangement has been made under which all their output, which is not very considerable, will pass through the hands of the new distributing centre. The secretary is Mr. C. Honeywill, and his firm, Messrs. Honeywill Brothers, of Mark Lane, London, E.G., will act as agents for the Company.

This Combine is perhaps in some ways the most important movement which has ever taken place in the spirit trade, and viewed in conjunction with the drift in Scotland and Ireland towards a "Trust" of all the manufacture for beverage purposes of spirits by the patent still process, must be accepted, for good or evil, as another step towards a gigantic spirit trust, embracing the manufacture of patent still spirits in the three kingdoms.

The Combine may partly have originated in the competition, which from time to time has existed, of the methylators among themselves, which competition was accentuated and aggravated by the fact that every now and then, when a surplus of grain spirit had to be got rid of in Belfast and in Scotland, not to speak of Liverpool and Bristol, and the surplus was generally placed by a cut under the figure at which the regular makers would quote. The whole difficulty, competition, or whatever it may be called, has now been accommodated by those who caused the trouble having been admitted into the Combine, and receiving shares in it, their fraction having, of course, to come out of the share of the regular makers of the old informal association. In its immediate effects upon trade profits in the methylated business the new move is to be commended in the interest of all concerned. The methylator will have to compete as usual, but he will not have to compete with a rival who has bought his spirit at less money.

The Company is not a Company for profit; profit must be made or not made at the distillery. It is purely a distributing concern at a price to be fixed, from which there is to be no departure to any individual buyer, no matter how large the purchases of that individual methylator or manufacturer may be.

The advantages of such a combination are obvious. In the first place, as just mentioned, a uniform price is ensured; secondly, a great saving of carriage is made. It will be at once seen, that to have the nearest outlet for the spirit appropriated to the particular distillery which can with least carriage serve the customer must mean a great saving on the whole to the Combine. It will be none of the members' interest to increase, at the expense of another member of the Company, their output; that is defined by the proportion of orders to which the member is entitled to by his share in the Company.

It will at once be asked by those who know anything of the methylating trade, what provision has been made for dealing with those distillers who themselves methylate the spirits they make? Such distillers would obviously have a small pull over those

who had to pay a commission to the agents on sales to the methylators or manufacturers. This has been met by providing in the Articles of Association for the payment into the Company's funds, by the distillers who methylate, of a sum per gallon equal to the selling commission payable by the Combine to the agents.

The point just mentioned is the only resemblance to the well-known "pooling" process, by which those who sold more, paid into, aid those who sold less than their proportion received, out of the "pod," so much per gallon.

That the Industrial Spirit Supply Company is in itself apparently not a formidable engine of capitalism would seem to be shown by its registered capital being £1000 in twenty shares of £50 each, in fact, as at present constituted, it is merely an invoicing office, through which all the output of spirits sold by the above-named distillers for methylating or manufacturing purposes must pass. We share then the declared opinion of the promoters that it is at present a most innocent association of manufacturers formed to prevent undercutting of prices, and to afford buyers of spirits for industrial purposes a guarantee that there is no lower price than the one at which they are buying.

It will be able to regulate the inflow and outflow of spirits, with Messrs. Honeywill's hands, as it were, on the tap, so that the possible inroad of the German Centrale may be controlled, by a fall in tie price on the one hand, if that Spirit Ring wants to send in spirits here, or be provided with spirits from this side, if the surplus here, and the price over there, warrant the shipment to the Continent of British spirits.

While we indicate above that apparently the general effect, it present, of the new Supply Combine will be of benefit to the traders concerned, we cannot conceal the view which must present itself to the mind of those who have studied the question of monopolies, that they always begin by disclaiming any intention of, at any time, bearing hardly on those whom they supply, and thereby bearing hardly on the dependent industries, and finally on the public. We know of a certain place the way to which is paved with good intentions, and we cannot but foresee that this monopoly within another nearly organised monopoly, may turn out ultimately of anything but advantage to the industries which may be concerned in the production and distribution of industrial and methylated spirits.

Fortunately, perhaps, for those branches of our national commerce which have to look to supplies of cheap alcohol in competition with Germany in particular, where the alcohol used for purposes other than drinking is subsidised and thus rendered

artificially cheap for the industries using it, and for consumption for motive power, lighting and heating purposes, we, in order to enable our manufacturers to compete, have lately granted the same drawback to spirits industrially used as to those exported.

As the new Combine heralds an approaching rise in the price of industrial spirits, we see foreshadowed in this a movement which might become dangerous, if the distillers should become too desirous of profit. Happily, however, there is a constant check at present existing in the German article, which will be always on the watch to come in if the price here of the British article is unduly pushed upwards. At present, the Combine would be quite safe at some pence higher, but it is quite likely that in another six months to a year the volume of German production may again bring down the figure over there to a dangerously low point. However, a move up or down becomes now a matter of twenty-four hours with the central bureau of the new Supply Company.

41. Translator's note. There is no adequate English translation for the German "Verlagsystem," "Verleger," etc. It means a special kind of capitalist organisation, and cannot therefore, as Mr. Unwin has pointed out ('Industrial Organisation,' pp. 3–4) be well identified with the "domestic system" proper. The "Verlagsystem" differs from the "domestic system" in so far as it has a definite capitalist basis, and from the ordinary "factory system" in so far as the workman does his work at home. The capitalist (merchant, employer, factor, etc.) controls the domestic worker or craftsman by advancing , him money or machinery or supplies of raw material, in return for which the worker delivers to him the bulk of his output. The system shows a good many variations, but the essential feature is always in domestic work in direct economic dependence on a capitalist entrepreneur. The "commission system" has been suggested as an equivalent, but in the absence of any recognised term I have thought it better as a rule to avoid the appearance of a technical expression.

43. Ashley, 'History of English Industry,' Leipzig 1896, p. 230 ff. and p. 238 ff.
44. We hear of small masters complaining in 1689 of "some merchants that keep journeymen, cloth workers, packers, dyers and others to work in their houses and not only employ them in doing their own work but also other merchants' clothes, which in the end will prove the ruine of many families in the working trade."
45. Though Prof. Cunningham ('Growth of English Industry,' i. p. 499) is of opinion that handicraft "maintained its ground" in cloth weaving until the rise of factories, we can only understand him to mean in most cases a dubious struggle for existence against capitalism working partly with the domestic system and partly with the factory.

46. Cf. for this statement Unwin, 'Industrial Organisation,' p. 73 ff., pp. 197 and 198, p. 199 ff., p. 209 and passim. For the classification of cloth weavers, *ibid.* pp. 234–36.
47. This result contradicts the frequently repeated contention that industrial capitalism started in England in about 1760. For instance Toynbee ('Industrial Revolution,' London 1884, pp. 53–4) basing himself on observations concerning the domestic system in the wool and linen weaving of the eighteenth century says: "This was the nearest approach to the capitalist system before the beginning of the great technical discoveries." Like many other writers, Toynbee fixes his attention on the textile industry alone (besides the nail industry, which he admits to be worked on the factory system), and overlooks a great number of industries which, as we have shown above, had long been bound up with capitalism, and had in some cases even advanced beyond the system of depending on capitalists for supplies.

59. 'Parliamentary History,' vol. ii. p. 650.
60. Mr. F. C. Montagu in his 'History of England' (London 1907, vol. vii. p. 181) thinks that the Act of 1624 was evaded on the pretext that it only relates to monopolies given to individuals. For this opinion he gave no evidence. It is clear that the Act forbade all monopolies, whether for individuals or bodies corporate or politic whatsoever. Also monopolies were granted to individuals after 1624, just as before, e.g., one for glass in 1634.

120. Wilkins, p. 13.
121. Price, pp. 125–127.
122. Unwin, ‘Industrial Organisation,’ p. 145, speaks of “the tendency of industrial privileges vested in bodies of craftsmen to fall into the hands of speculating capitalists, who could attempt to exploit the industry somewhat on the lines of the modern trust. Failure in these enterprises was quite as frequent as success, and the breakdown of one projector afforded the Government the opportunity of issuing another patent covering the same privilege. In this way one monopolist

took the field against another monopolist, and the interests of the craftsmen, which were the supposed motive of the grant, so far from being forwarded, were not even considered.”

123. Unwin, ‘Industrial Organisation,’ pp. 165–168.

124. Price, p. 40.

125. Unwin, p. 168.

173. 'English Patents of Monopoly,' p. 125.

174. About 1650 a judgment was given as follows: "Certainly upon a serious consideration all such patents and bye-laws as tend most to the well regulating and ordering of trades and the better management of them, so that the benefits of them may be derived to the greater part of the people, though with a prejudice to some particular persons, have always been allowed by the law, but patents which tend to the engrossing of trade, merchandise and manufacture, into one or a few hands only, have always been held unreasonable and unwarrantable."
175. Macaulay, vol. viii. pp. 12, 13.
176. 'Parliamentary History,' vol. ii. p. 653.

254. Cf. Dr. Karl Knapmann's excellent book, 'Das Eisen- und Stahlgewerbe in Altena,' Leipzig 1907: Motives of the Association, pp. 40, 68, 69 and 104; Compulsion, pp. 44, 45, 46, 49, 50, 53, 66 and 95; Limitation of Production and Repartitions, pp. 48, 51, 56, 62, 77–9, 95 and 100; Fixing of Prices, pp. 55 and 83; Influence of Freedom of Trade, pp. 86, 88, 89, 100, 101, and 105.
255. Cf. for this account Troeltsch, pp. 73–76, 84, 113 ff., 130, 323 ff., and 327. That the rise of the factory system must shatter the old form of trade organisation on the domestic system is clear. But a monopoly might continue under the former system, and the Calw company's factory actually possessed a monopoly. The dissolution of the company was, however, primarily due to changing markets, which necessarily led to reduced profits even with such a monopoly.

261. Ibid. pp. 489 and 755.
262. No comparison has been made here with the monopolist organisation of early industrial capitalism in France, advisedly. It may, however, be remarked that Chaptal, unlike English writers, was very well aware of the importance of the monopolies which French industry had had, especially that of the privileged factories, and of the contrast between these monopolies and the later freedom of trade. Vide 'De l'Industrie Française,' Paris 1819, vol. ii. pp. 372 and 379, 380. For the monopolies of the eighteenth century vide G. Martin, 'La Grande Industrie en France,' Paris 1900, pp. 224–232.
263. Cf. von Justi, 'Abhandlung von den Manufakturen,' Copenhagen 1767, pp. 149, 150.
264. For an instance see 'A Brief Essay on the Copper and Brass Manufacture of England,' London 1712, p. 20. The author defends high duties thus: 'Whoever lives a few years will probably see many more undertakers of these works, who, by striving to undermine one another, will always keep prices low.'

496. Macrosty, ‘The Trust Movement in British Industry,’ p. 86; Ashley, ‘The Adjustment of Wages,’ p. 26.
497. This has again been noticeable recently, at the beginning of 1907. When at that date coal prices rose quickly the *Economist* said (Feb. 2, 1907, p. 188): “There is no influence of any combine in the matter, though there has been formless gossip about a hypothetical ring in South Wales to capture the London trade. We should imagine that London consumers could manage to get along quite well without Welsh coal at all, seeing that they derive most of their supplies from the North and the Midlands.” So that Prof. Liefmann’s opinion (‘Schutzzoll und Kartelle,’ p. 11), that the Welsh coal mines could form a cartel independently of those in the Newcastle district, is incorrect.
498. A certain rise of prices is possible in individual cases. Cf. Ashley, ‘Adjustment of Wages,’ p. 49, note 1.
499. Report on Coal, 1873, p. 10.
500. Macrosty, ‘The Trust Movement in British Industry,’ p. 86.
501. Jeans, ‘Trusts, Pools, and Corners,’ p. 62. 3400 seems to me an exaggeration. An expert gave me the number for the present day as 1500.

552. Cf. Ryland's 'Directory,' 1906.
553. Jeans, 'Iron Trade of Great Britain,' p. 175.
554. Cf. Report of 8th Annual Meeting of Richardsons, Westgarth & Co., 29. xii. 1908; also Report of the Tariff Commission, vol. iv.; 'Engineering Industries,' London 1909, § 1091.
555. Cf. Levy, 'Einfluss der Zollpolitik auf die wirtschaftliche Entwicklung der Vereinigten Staaten von America,' Conrad's 'Jahrbücher,' 1906, p. 646.
556. Heymann, 'Gemischte Werke im deutschen Grosseisenswerbe'; Levy, 'Stahlindustrie,' passim.
557. H. Grossmann, 'Die Bedeutung der chemischen Technik,' Halle 1907, p. 35.
558. Cf. for these statements, 'Statistical Abstract,' 1908, p. 157; 'Trade and Navigation,' 1908, p. 151; Levy, 'Entwicklungsgeschichte einer amerikanischen Industrie,' Conrad's 'Jahrbücher,' 1905, vol. xxix. p. 145 ff. Exports from the Union to Canada in 1907 amounted to 2447 dols., whilst tin plates from Great Britain reached the figure of £261,000. Cf. 'Commercial America in 1905,' Washington 1906, p. 77, and Report of the British Iron Trade Association, 1906, p. 19.
559. 'Kontradiktorische Verhandlungen,' Heft 9, p. 152. "The condition of the English industry governs the German market, as the German price is fixed according to directors of the syndicate on the basis of the English quotations."
560. Cf. 'Kontradiktorische Verhandlungen,' Heft 9, p. 153 passim. The opinions of different manufacturers, who remarked on the fact that there is no trained race of workers in the German

tin-plate industry, seem quite credible. The importance of such a race of workers specially in this branch of industry, is recognised in England also. Cf. for instance, Tariff Commission Report, vol. i. 1904, §889.

561. *Ibid*, particularly page 120, also pp. 118, 119. From the accounts given there by Messrs. Capito & Klein it is easy to see what difficulties lie in the way of the supply of raw material.

562. Cf. for instance, Tariff Commission Report, vol. i. §§ 1155 and 1145, where the introduction of a duty on semi-finished goods is opposed by manufacturers in the interest of the tin-plate industry.

563. Cf. Rylands' 'Directory,' 1906, pp. 740-748; the word "works" is often identified with mill. Thus, Dr. Wendland, in the Kartellenquete (cf. 'Kontradiktorische Verhandlungen,' Heft 9, p. 152), maintains that there are 500 "mills" in England. On the contrary a tin-plate mill is only a rolling plant, many of which are, as a rule, owned by one works.

564. Report, British Iron Trade Association, 1907, p. xviii.

565. Levy, 'Stahlindustrie,' p. 180, ff.

566. *Ibid*. p. 986.

567. Even in America the tin-plate branch of the Steel Trust has met with growing competition. According to the 'Iron Age,' January 7, 1909, p. 45, the number of mills working at the end respectively of

	Trust.	Outsiders.
1902	264	71
1903	264	71
1904	242	83
1905	248	109
1906	255	110
1907	242	110
1908	242	100

It must not be forgotten that an American tin-plate works requires more capital than an English one, and that therefore the rate of increase is bound to be slower.

568. The case of an undertaking containing many separate branches of trade concentrated in itself is different.

743. In protectionist countries production grows more quickly when the home demand increases than under free trade, where most of the extra demand can be met from abroad. But the more this is the case, the more extensive the over-production when the demand falls, and the greater the fall in prices. Cf. H. Dietzel, 'Das Produzenteninteresse der Arbeiter und die Handels-freiheit' (Berlin 1903), pp. 63–65, and concrete examples quoted in Levy, 'Einfluss der Zollpolitik auf die Vereinigten Staaten,' in Conrad's 'Jarhbücher,' 1906, pp. 641–45.

752. A correspondent in the 'Ironmonger,' the chief organ of the retail iron trade, complains in the issue of January 23, 1909, of the price policy of about twelve wire netting makers who have organised a cartel called the "Wire Netting Association." "The public," he says, "feel these high prices, and tell you that wire netting is not worth the price asked to-day. ... As some netting is little better than a spider's web after it has been on one season, our customers have found substitutes. There are miles of fencing made of wood lattice, 3 in. by ½ in. by 6 ft., cut in segments. I think it is time the associations turned their attention to the customers, and not to those who monopolise any branch of the trade.'
753. Levy, 'Stahlindustrie,' p. 251.
754. Of course losses arising from competition influence the formation of monopoly as much as prospective profits, and equally assist in making combination appear desirable to even a large number of firms with divergent interests. Intensity of competition and the difficulty of transferring capital emphasised by Prof. Brentano help in the same direction, and are factors which, given the practical conditions necessary for the monopolisation of production in the hands of a certain number of makers, often render it especially attractive or imperative for producers.

765. 'Archiv für Sozialwissenschaft,' 1505, pp. 346 and 348.

766. It is not in itself inconceivable that high prices might call forth undertakings inferior in organisation and technical appliances to the most profitable undertakings. But this does not in practice often happen where materials can be obtained at similar prices. Where the supply of materials is inelastic, and the high working expenses of a new undertaking are due to the fact that it can only exist at all by exploiting less favourable sources, matters are different.

The argument may be put in tabular form thus; the brackets representing the result of combination on the number of firms and the cost of manufacture.

Number of firms each with a productive power of x .	Selling Price. Cost of manufacture per x .	
	£.	£.
1	31	7
2 1	29	7 24
3	27	7

For clearness, various facts which might alter the situation in given cases, though not the principle, are here omitted. Under given circumstances, for instance, a trust might be able to meet

an increased demand beyond its existing productive power by the addition of smaller concerns, not in themselves profitable industrial units. A would-be rival of the American Beet Trust would have to establish, in addition to enormous slaughter houses, secondary branches to dispose of bye-products, trains fitted with cooling apparatus, staff, and so on, equal to those of Messrs. Armour and Swift. But the latter could certainly themselves build new slaughter houses if the demand rose without requiring to increase their output at once to the extent that a new comer starting from the beginning would have to do. The fact that large firms have opened new slaughter houses, therefore, in no way contradicts, as Vogelstein thinks it does ('Archiv für Sozialwissenschaft,' 1906, p. 555), my view, based on this very instance, that trading on a large scale can in itself have an element of monopoly.

768. 'Englischer Freihandel und Britischer Imperialismus,' pp. 270–77.

769. Hirst, 'Monopolies, Cartells, and Trusts,' p. 169. He holds that English combinations cannot raise prices above the "natural" level, i.e., the level of import prices, and therefore are harmless. But in the case of goods which were cheaper in England than abroad, foreign import prices might seem to the consumers "unnaturally" high. It is rather Utopian for the 'Economist' to say (July 4, 1908, p. 16): "It is next to impossible for combinations to maintain prices in a free trade country above the legitimate (sic) level determined by the conditions of demand and supply." Mr. Pierce, in his very remarkable book, 'The Tariff and the Trusts' (New York 1907), p. 57, says: "That trusts exist in free trade countries as well as in protectionist countries is undeniable, but while in the former the economy in production which results from their promotion goes to the benefit of the consumer in the shape of reduced prices, in the latter they are identified with high prices to the consumer and large profits to the producers." Prof. Brentano ('Die beabsichtigte Neuorganisadon der deutschen Volkswirthschaft,' p. 278) also thinks that under free trade "cartels are limited in their beneficial effects." Compare also Dietzel, 'Sozial Politik und Handelspolitik,' 1902, p. 23.
